# Status report of expert group on Space Weather

**Takahiro Obara** (*Chair of EG-C*)

---

(After T.G.Onsager and J.Head )

# Outline of the presentation

- 1) Aim of expert group on space weather and work plan
- 2) Status report on
  - Identification of risks
  - Coordination of space weather monitoring
  - Development of space weather forecast tools
  - Capability building of comprehensive network
- 3) Draft of working report contents

# Influence on spacecraft by space environment

**Plasma**

**Radiation particles**  
 - High-energy particles  
 - Galactic cosmic ray

**Neutral particle**

**Ultraviolet rays  
X rays**

**Meteoroid  
Debris**

**Electrification**

**Ionizing damage  
Transformation damage**

**SEU**

**Drag**

**Surface deterioration**

**Collision**

- Electromagnetic pulse
- Output decrease in power supply
- Damage

- Deterioration of an electric circuit
- Deterioration of optical parts
- Deterioration of a solar cell

- Data error
- Image noise
- System hung
- Circuit damage

- Torque
- Orbit fall

- Deterioration in the thermal, electric, and optical characteristic
- Deterioration of structure
- Structure damage
- Decompression

## Aim of the **Expert Group on space weather**

---

-> to contribute long-term sustainability working group by doing tasks to provide **a report** based on the survey of current practice and procedure and a set of **guide lines** which would contain the ways to reduce space weather risks and technical standards.

23 States joined by now

## Scope of the **Expert Group** (after ToR)

---

- i) Collection, sharing and dissemination of **data, model and forecast tool**
- ii) Capabilities to provide a comprehensive and sustainable **network** of sources of **key data** in order to observe and measure phenomena related to space weather in real time or near-real time
- iii) Open sharing of established **practices** and **guidelines** to mitigate the impact of space weather phenomena on operational systems
- iv) Coordination among State on ground-based and space-based space weather observations in order to safeguard space activities.

# Methodology – time line (after ToR)

| Year                               | <i>2 0 1 2</i>  |                   |                   | <i>2 0 1 3</i>             |                   |                   | <i>2 0 1 4</i>             |          |

| Expert Group Repot                 | <i>Out Line</i> | <i>1-st draft</i> | <i>2-nd draft</i> | <b><i>Final Report</i></b> |                   |                   |                            |          |
| Guide Line Paper                   |                 |                   |                   | <i>Out Line</i>            | <i>1-st draft</i> | <i>2-nd draft</i> | <b><i>Final Report</i></b> |          |

# Identification of risks (1/3)

|   | Item                              | Influence and concern  |
|---|-----------------------------------|--|
| 1 | Level and Trend of Solar Activity | General space environment risk evaluation.   |
| 2 | Solar X-ray Radiation             | Solar X-ray radiation is the widely used indicator for solar activity level and flare and associating disturbance harmful for space systems.   |
| 3 | Solar High Energy Particle        | Onboard computer malfunction due to upset of semiconductor devices, deterioration of SAP, electric devises, optical sensor etc...  |
| 4 | Solar Flare and CME               | Solar flares and associating CME are a major source of space environment disturbances. Generally, long duration and strong flares are thought to be important for risk evaluation on satellite operation sources of geomagnetic storms |
| 5 | Coronal Holes                     | Coronal holes are a major source of high speed solar wind, which produces geomagnetic storm.   |

# Identification of risks (2/3)

|    | Item                           | Influence and concern  |
|----|--------------------------------|--|
| 6  | Galactic Cosmic Rays           | Onboard computer malfunction due to upset of semiconductor etc...  |
| 7  | Solar wind plasma              | Geomagnetic storm and Sub-storm caused by high speed wind stream are the potential causes of satellite malfunction.  |
| 8  | K-index of geomagnetic field   | General space environment risk evaluation.   |
| 9  | Dst-index of geomagnetic field | General space environment risk evaluation.   |
| 10 | Low energy electrons at GEO    | KeV electron is considered major driver of satellite surface charging and following discharging. The surface charging and discharging is one of the major cause of GOE satellite malfunction.  |
| 11 | High energy electrons at GEO   | High energy (>MeV) electron is considered a major driver of satellite charging and following discharging including component and harness inside spacecraft. The charging and discharging is one of the major cause of GOE satellite malfunction. |

# Identification of risks (3/3)

|    | Item                        | Influence and concern   |
|----|-----------------------------|---|
| 12 | Low energy electrons at LEO | KeV electron is considered major driver of satellite surface charging and following discharging. The surface charging and discharging is one of the major causes of LEO satellite malfunction.                      |
| 13 | High energy protons at SAA  | Onboard computer malfunction due to upset of semiconductor devices, deterioration of SAP, electric devises, optical sensor etc...   |
| 14 | Solar EUV proxy index       | The proxy called f10.7 is used as solar EUV proxy parameter to deduce satellite drag on satellite orbital analysis. Abrupt increase of the proxy may cause severe trouble due to drastic changes of satellite drag. |
| 15 | Auroral Electro jet index   | The AE is used to atmospheric density model, which leads to satellite drag on satellite orbital analysis. Abrupt increase of AE may cause severe trouble due to drastic change of satellite drag.                   |
| 16 | Ionospheric Disturbances    | Operation of satellite at various altitude and ground communications by using radio waves are influenced by the ionospheric condition.  |

# Space weather monitoring (1/2)

|    | Item                              | Measurement in Japan (for example)  |
|----|-----------------------------------|---|
| 1  | Level and Trend of Solar Activity | f10.7 radio index (NICT)  |
| 2  | Solar X-ray Radiation             | None  |
| 3  | Solar High Energy Particle        | In-situ measurement by satellite sensor (JAXA)  |
| 4  | Solar Flare and CME               | Ground-base observation (NICT)  |
| 5  | Coronal Holes                     | Remote measurement by satellite sensor (JAXA)   |
| 6  | Galactic Cosmic Rays              | Measurement by satellite sensor (JAXA)  |
| 7  | Solar wind plasma                 | Measurement by satellite sensor (JAXA)  |
| 8  | K-index of geomagnetic field      | Ground based magnetometer observation network and its real-time data circulation (SERC) |
| 9  | Dst-index of geomagnetic field    | Ground based magnetometer observation network and its real-time data circulation (SERC) |
| 10 | Low energy electrons at GEO       | None  |

## Space weather monitoring (2/2)

|    | Item                         | Measurement in Japan (for example)  |
|----|------------------------------|---|
| 11 | High energy electrons at GEO | In-situ measurement by satellite sensor (JAXA)  |
| 12 | Low energy electrons at LEO  | None  |
| 13 | High energy protons at SAA   | In-situ measurement by satellite sensor (JAXA)  |
| 14 | Solar EUV proxy index        | None  |
| 15 | Auroral Electro jet index    | Ground based magnetometer observation network and its real-time data circulation (SERC) |
| 16 | Ionospheric Disturbances     | Ground based magnetometer observation network and its real-time data circulation (SERC) |

# Space weather forecast (1/1)

|    | Item                                | Forecast                       |
|----|-------------------------------------|--------------------------------|
| 1  | Sunspot                             |                                |
| 2  | Coronal hoes                        |                                |
| 3  | Flare/CME                           | *ISES/Flare forecast           |
| 4  | Solar proton                        | *ISES/Solar proton forecast    |
| 5  | Solar wind                          | Solar wind models              |
| 6  | Geomagnetic field disturbance (Dst) | *ISES/Storm forecast           |
| 7  | Geomagnetic field disturbance (AE)  | *ISES/Substorm forecast        |
| 8  | Radiation belt                      | Radiation belt models          |
| 9  | Aurora                              | Aororal oval prediction models |
| 10 | Ionosphere                          | Ionosphere models              |
| 11 | Radio wave propagation              | Disturbance models             |

# Comprehensive network

International Ursigram and World Days  
Service (IUWDS)

-> 1996 International Space Environment  
Service (ISES)

13 States:  
(Aug. 2011)

# Draft of the outline of the expert group report

---

- 1) Identification of Risks
- 2) Current practice and procedures
  - Observations
  - Models
  - Tools of Space weather prediction
  - Engineering approach to mitigate space environment effects
- 3) Capabilities to provide a comprehensive network to support space weather services
- 4) Recommendation on Coordination among States on space weather observations to safeguards space activities
- 5) Key findings and technical standards regarding SW

# Appendix

## Conclusion for EG-C

The “International Space Weather Warning Service” is expected to be continued and improved.

It is still need to make efforts for modeling, monitoring, forecasting, warning, design measures, operational actions against the risk from the natural environment.

(after technical presentation by Dr. A. Kato /JAXA)

Preventive  
Actions

Detection  
of risk

Corrective  
Action

Permanent  
Action

Modeling,  
Monitoring,  
Forecasting

Models of natural environment are being developed in ISO and other organizations. Some satellite have a monitoring sensors. Research is being done to forecast with higher precision.

Design  
Measures

Design standards, radiation hardness design as example, are being applied, and need to be developed more, .

Monitoring  
Detection  
Sending Alert  
/ Warning

Monitoring and warning services are available by the ISES. Provide space weather forecasting and send alert / warning if needed. They are expected to be developed more.

Risk  
Avoidance

In case of warned situation, operation mode will be shifted to safe-mode. Space crew will hide behind shielded area.

Monitoring,  
Analysis

On-ground and in-orbit monitoring and sharing observation data are encouraged.

Failure  
Analysis

In-orbit failures should be analyzed for its causes, and if they would be induced by the natural environment , design standards will be modified.

Low-energy electrons “stick” to the spacecraft surface.

High-energy electrons penetrate the satellite and can get embedded in insulating materials.

If electrons escape faster, charging and discharging will NOT occur.
