BRITE – BRight Target Explorer

World's first nanosatellite constellation dedicated to asteroseismology

Country	Satellite Name	ID	Launch	Orbit-P(min)	Filter
AUT	TUGSAT-1 / BRITE-A	Bab	2013-02-25	100.36	blue
AUT	UniBRITE	UBr	2013-02-25	100.37	red
POL	BRITE-PL2 'Heweliusz'	BHr	2014-08-19	97.10	red
POL	BRITE-PL1 'Lem'	BLb	2013-11-21	99.57	blue
CAN	BRITE-CA1 'Toronto'	BTr	2014-06-19	98.24	red
CAN	BRITE-CA2 'Montreal'	BMb	2014-06-19	n/a	blue

3 countries – 5 (6) satellites – ONE MISSION

Launch

TUGSAT-1/BRITE-Austria and
UniBRITE were launched by
PSLV-C20 of ISRO/ANTRIX
on 25 February 2013
from the Satish Dhawan Space Centre

Sun-synchronous LEO orbit

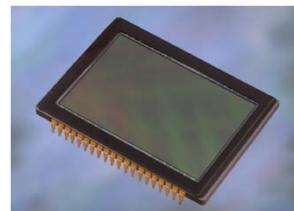

Courtesy: ISRO

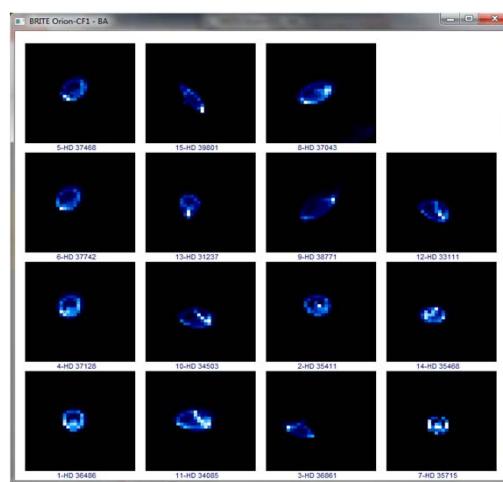

Scientific Goals

- Measurement of brightness and temperature variations of massive luminous stars (brighter than visual magnitude 4)
- Observations: 6 months typ.
- High duty cycle
- 2-colour (blue and red): satellites operate in pairs
- 24° field of view

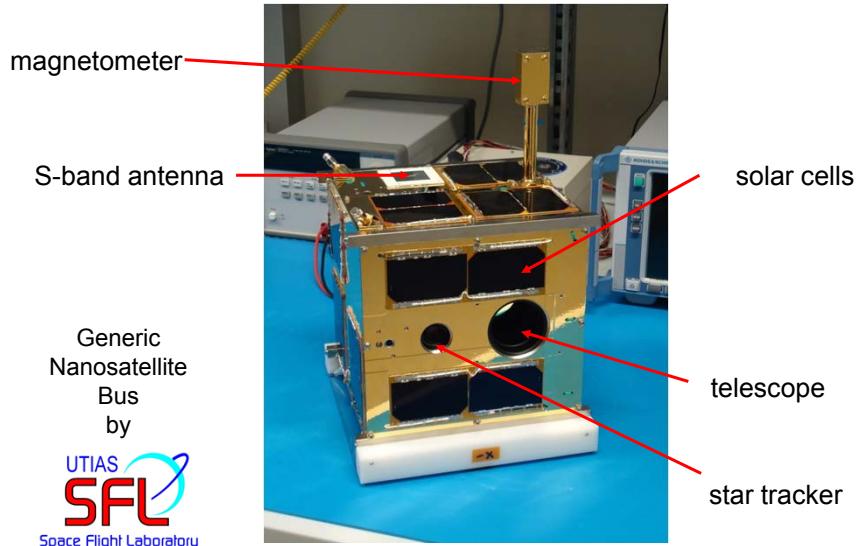

Raster Photometry

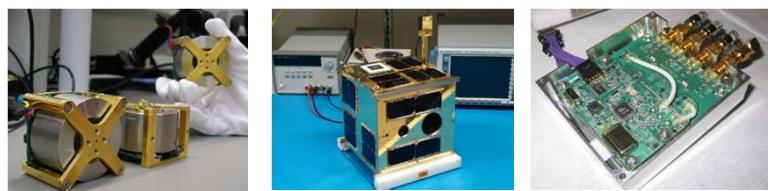

High pointing accuracy required: 1 arcminute

TUGSAT-1/BRITE-Austria Flight Model

BRITE Characteristics

- Nanosatellite: 20 x 20 x 20 cm
- Mass: 7 kg
- Electrical power: 6...11 W
- Transmit power: 0.5 W
- Frequency bands: S-band downlink / UHF uplink
- Data rates: 32...256 kbit/s downlink, 9.6 kbit/s uplink
- Pointing accuracy: 1 arcmin.
- Science data volume: 18...40 MB / day per satellite

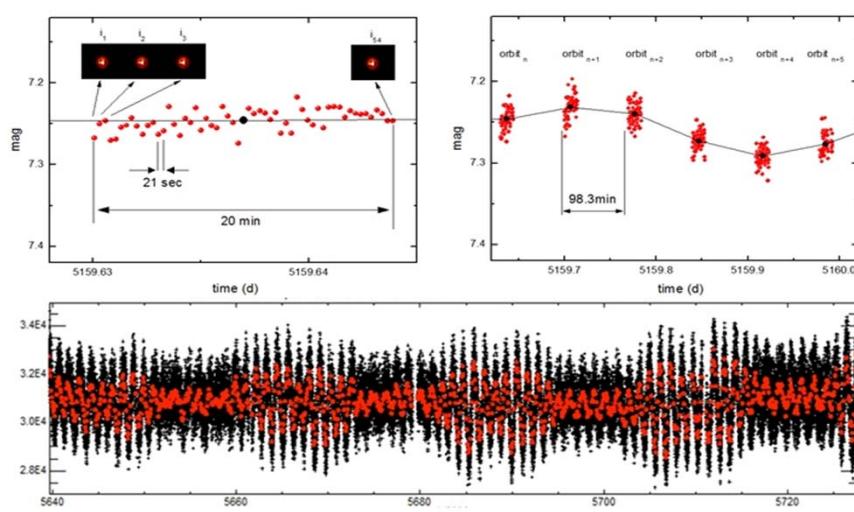

Mission Operations

- 14 orbits per day , 6-7 passes per station
- Operations:
 - Graz: BRITE-Austria and UniBRITE
 - Toronto: BRITE-Toronto
 - Warsaw: BRITE-Lem and BRITE-Heweliusz

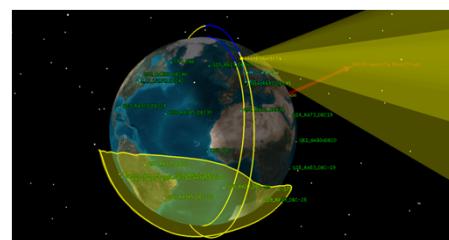

BRITE-Constellation: Data Sampling

Target Selection

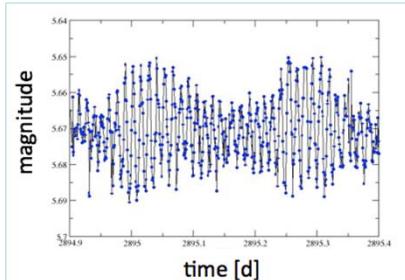

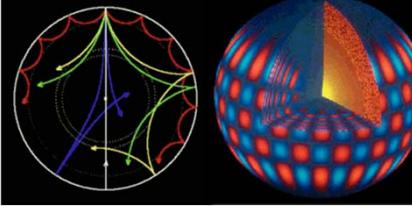

- BRITE Executive Science Team (BEST)
- Scientists from Austria, Canada, Poland, Germany, France
- BEST defines targets
- Commands for spacecraft prepared and uploaded by the operations teams

The world's smallest astronomical space satellites discovered the biggest stellar heartbeat

Stellar Pulsations

→

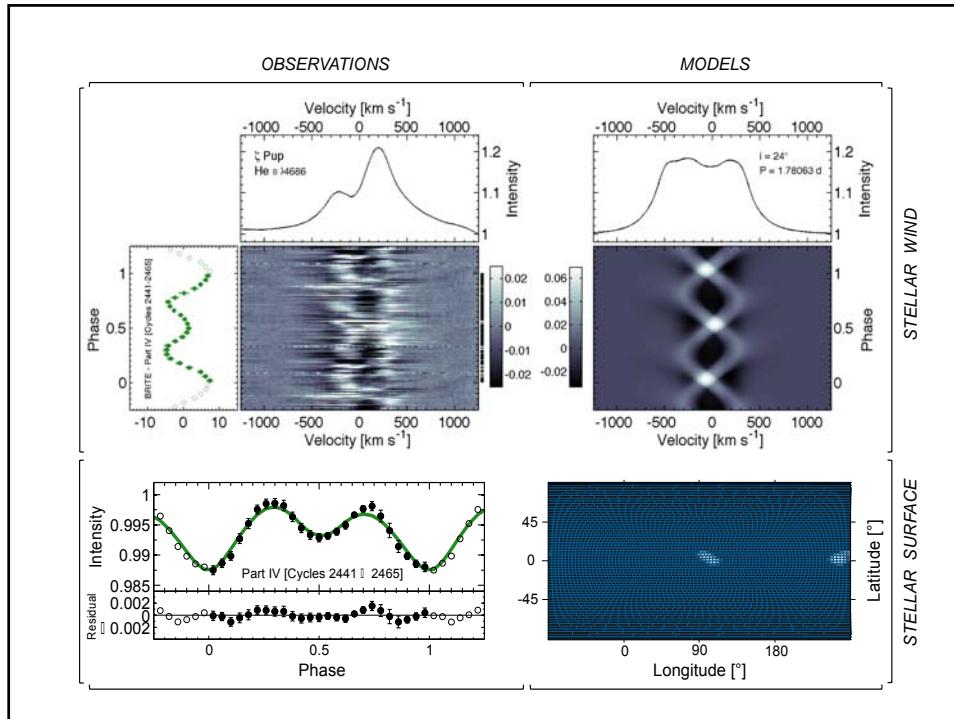

- Frequency
- Amplitude
- Phase

→

- Type of pulsation
- Properties of stellar interior

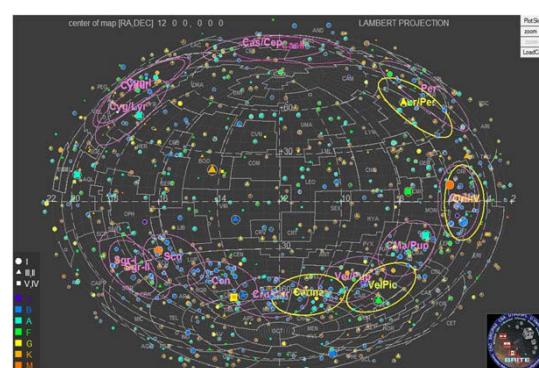

Synergies

between ground-based observations and
Space-based photometry (BRITE)
provide the only way to model the physics of a
distant star

BRITE-Constellation: Observing Fields

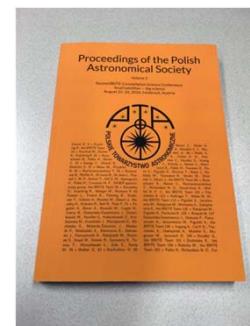

- 30 fields completed
- 5 fields ongoing

- 450 stars observed thus far
- 3.5 million measurements

Publications

- 14 peer-reviewed papers in top journals, e.g.
 - Astronomy and Astrophysics (top Europe)
 - Astrophysical Journal (top US)
- More than 60 articles in various conference proceedings
- Innsbruck proceedings (74 articles)
- Montréal proceedings in preparation

BRITE Science Conferences

- 2015: Gdansk (Poland)
- 2016: Innsbruck (Austria)
- 2017: Montréal (Canada)

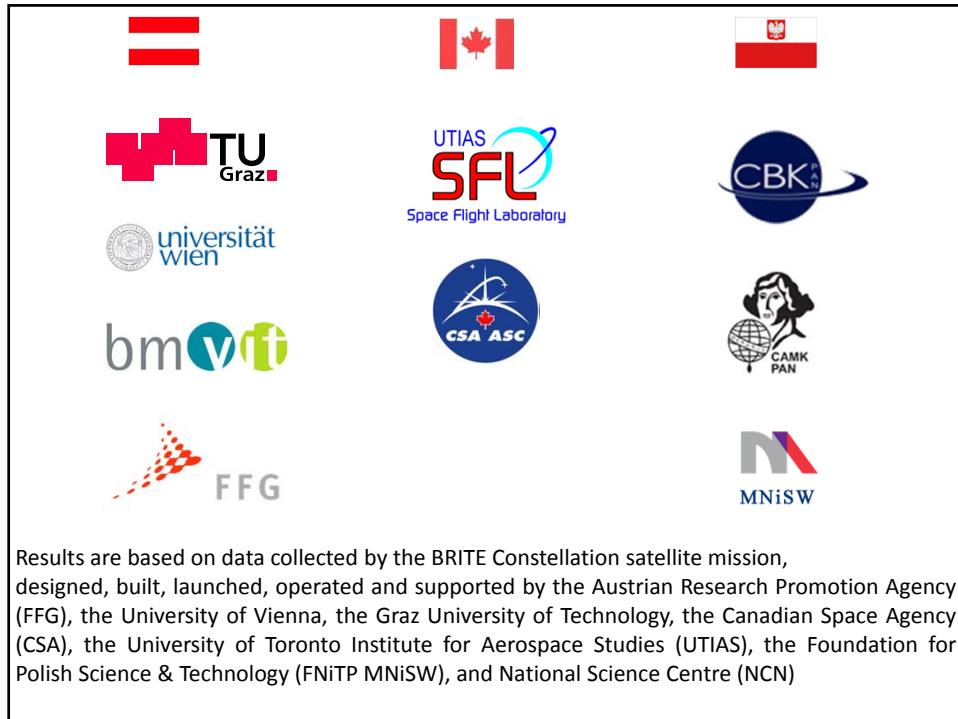

- More than 60 scientists participated in each conference

The Future

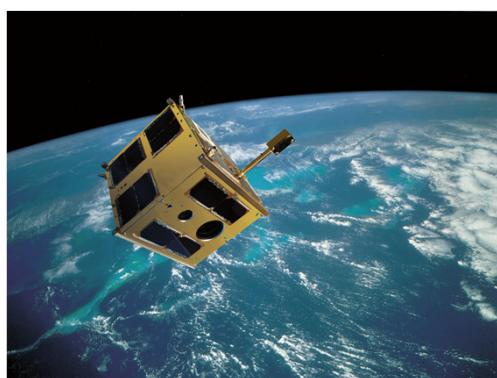

- Current performance evaluation:
BRITE can deliver scientifically relevant data
beyond 2020
- BRITE Science meeting in Wroclaw (Aug.2018)
- BRITE Science Conference Vienna 2019

Conclusion

- BRITE-Constellation is operating since Feb. 2013
- 5 satellites are collecting data every day from 3 ground stations
- Small, inexpensive spacecraft can fulfill demanding scientific objectives
- Significant scientific output from BRITE Constellation

Results are based on data collected by the BRITE Constellation satellite mission, designed, built, launched, operated and supported by the Austrian Research Promotion Agency (FFG), the University of Vienna, the Graz University of Technology, the Canadian Space Agency (CSA), the University of Toronto Institute for Aerospace Studies (UTIAS), the Foundation for Polish Science & Technology (FNiTP MNiSW), and National Science Centre (NCN)

Thank you for your attention!
