WAAS LPV Coverage

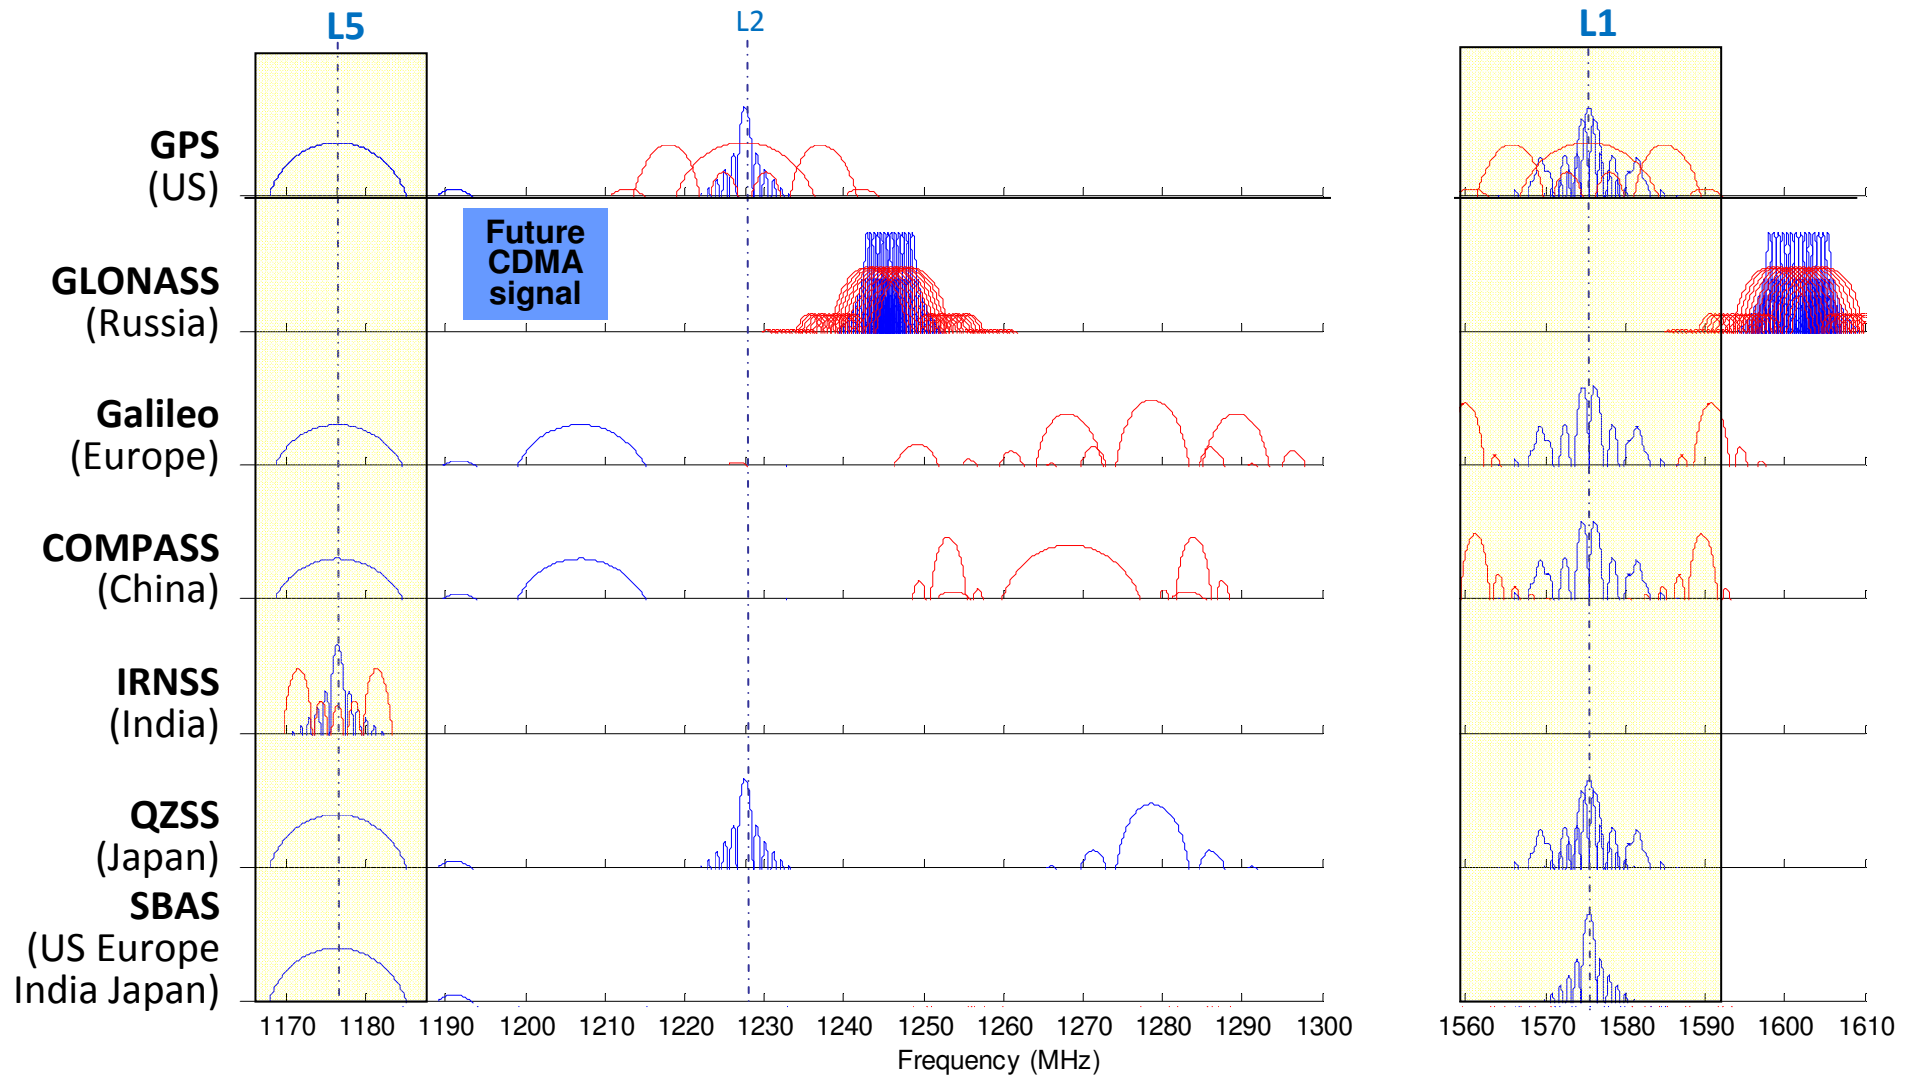

Current WAAS Vertical Navigation Service Snapshot Display

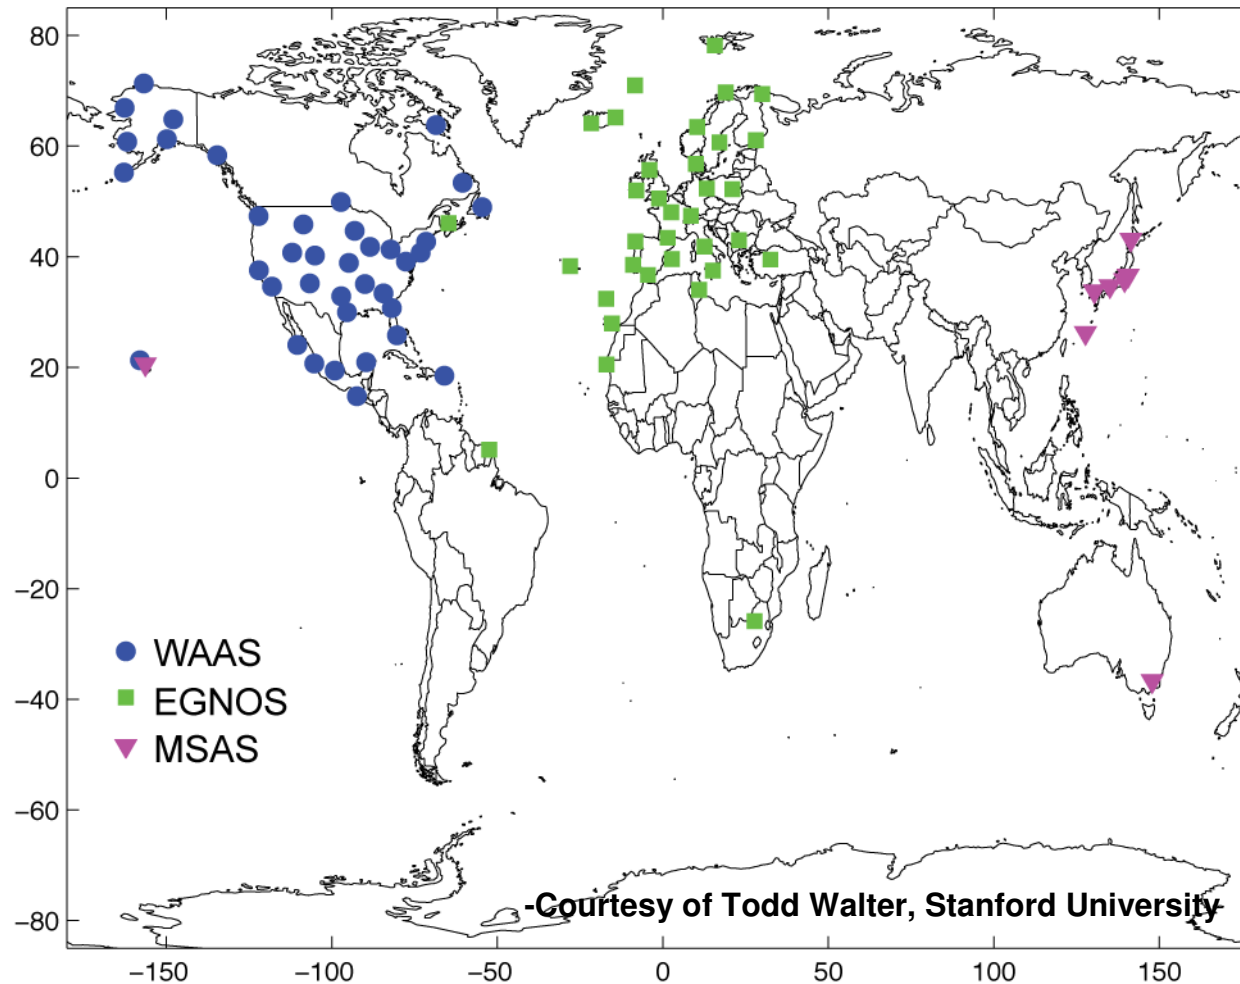

SBAS Future Considerations

- **Dual Frequency GNSS Services in protected aeronautical bands**
 - Enables direct estimation and removal of ionospheric delay errors
 - Single largest source of vertical position uncertainty
- **Most significant remaining threats are satellite failure based**
 - Design a new VPL equation targeting single satellite faults
- **New SBAS being developed by India and Russia**
- **Investigate potential to expand LPV to global coverage**

Current International Signal Plans

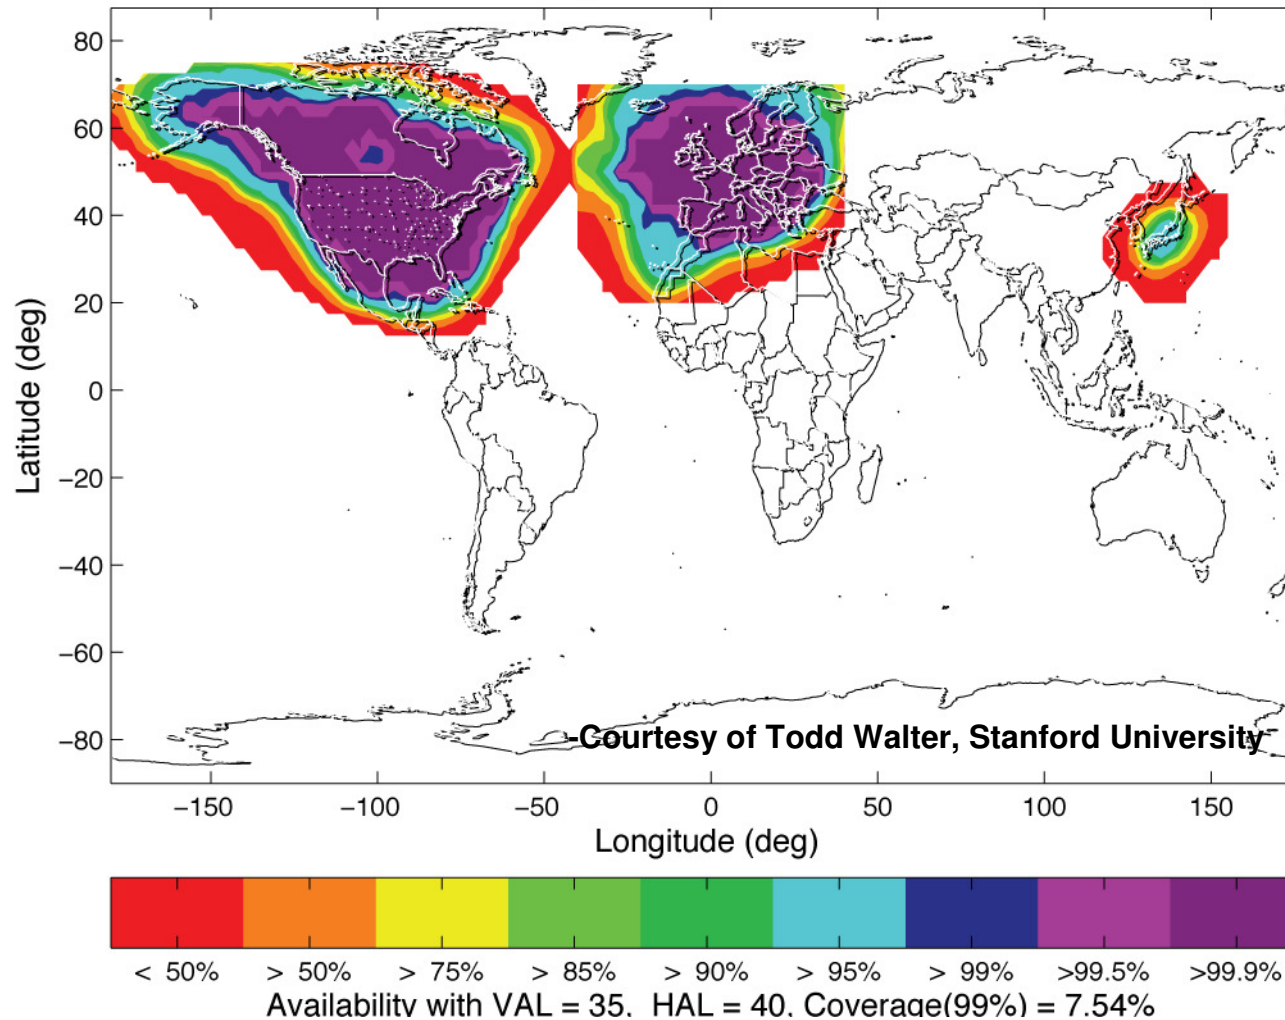

Current Reference Networks

LPV-200 Coverage Estimated (Single Frequency GPS)

Availability as a function of user location

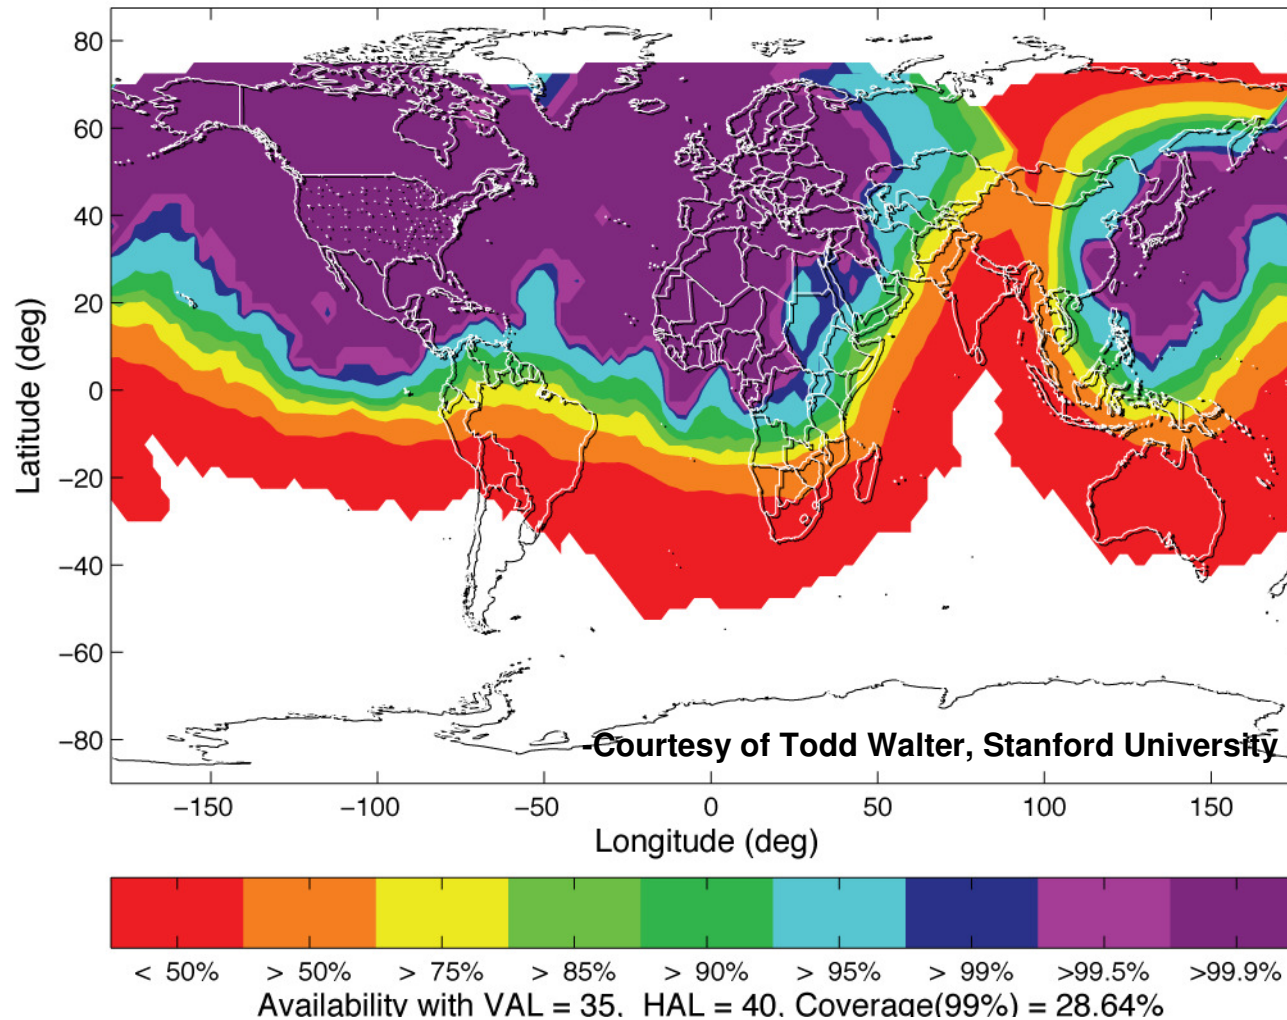

WAAS
EGNOS
MSAS

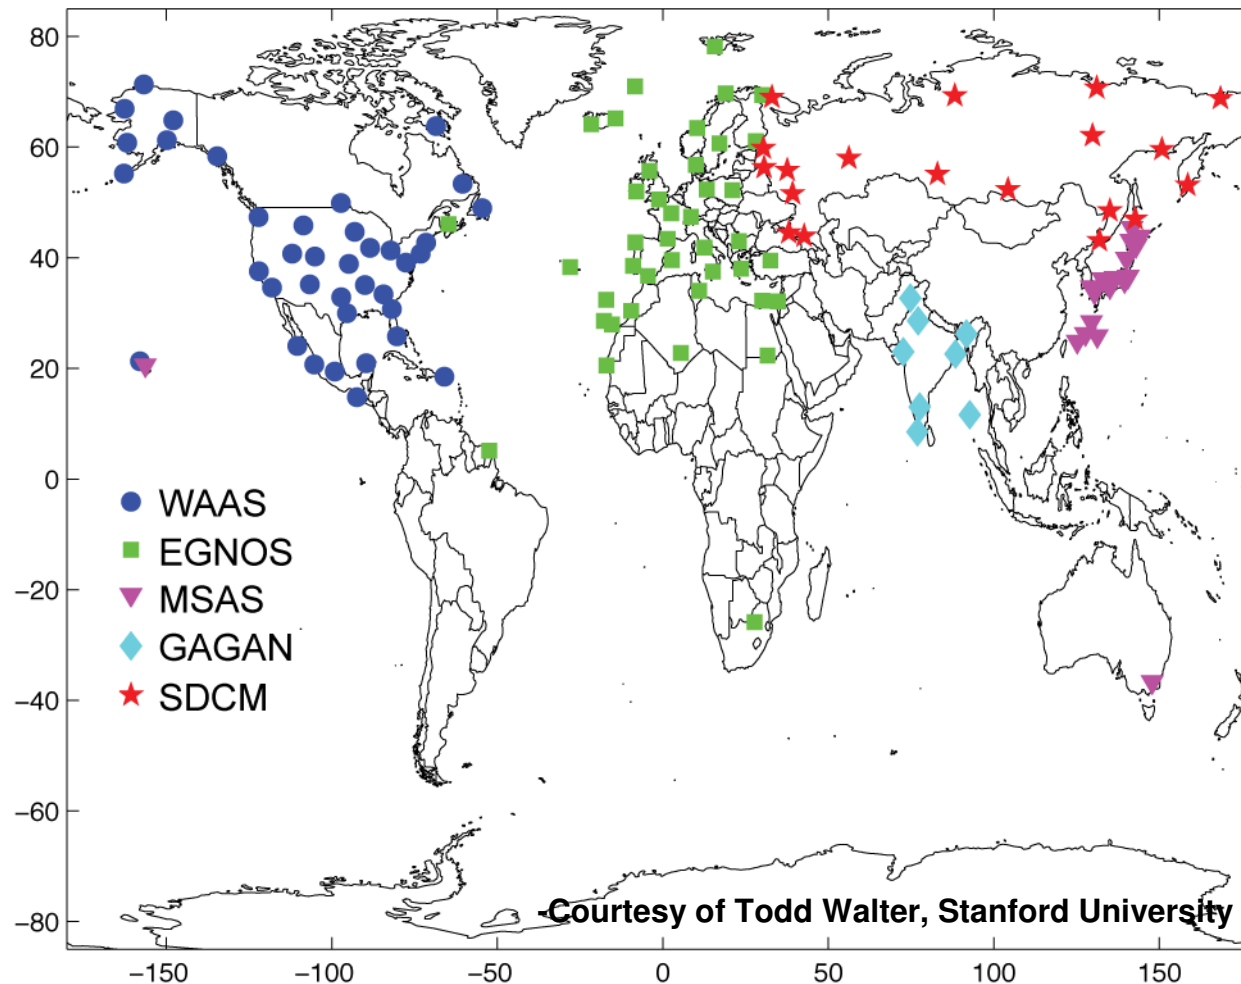

Future LPV-200 Coverage (Dual Frequency GPS)

Availability as a function of user location

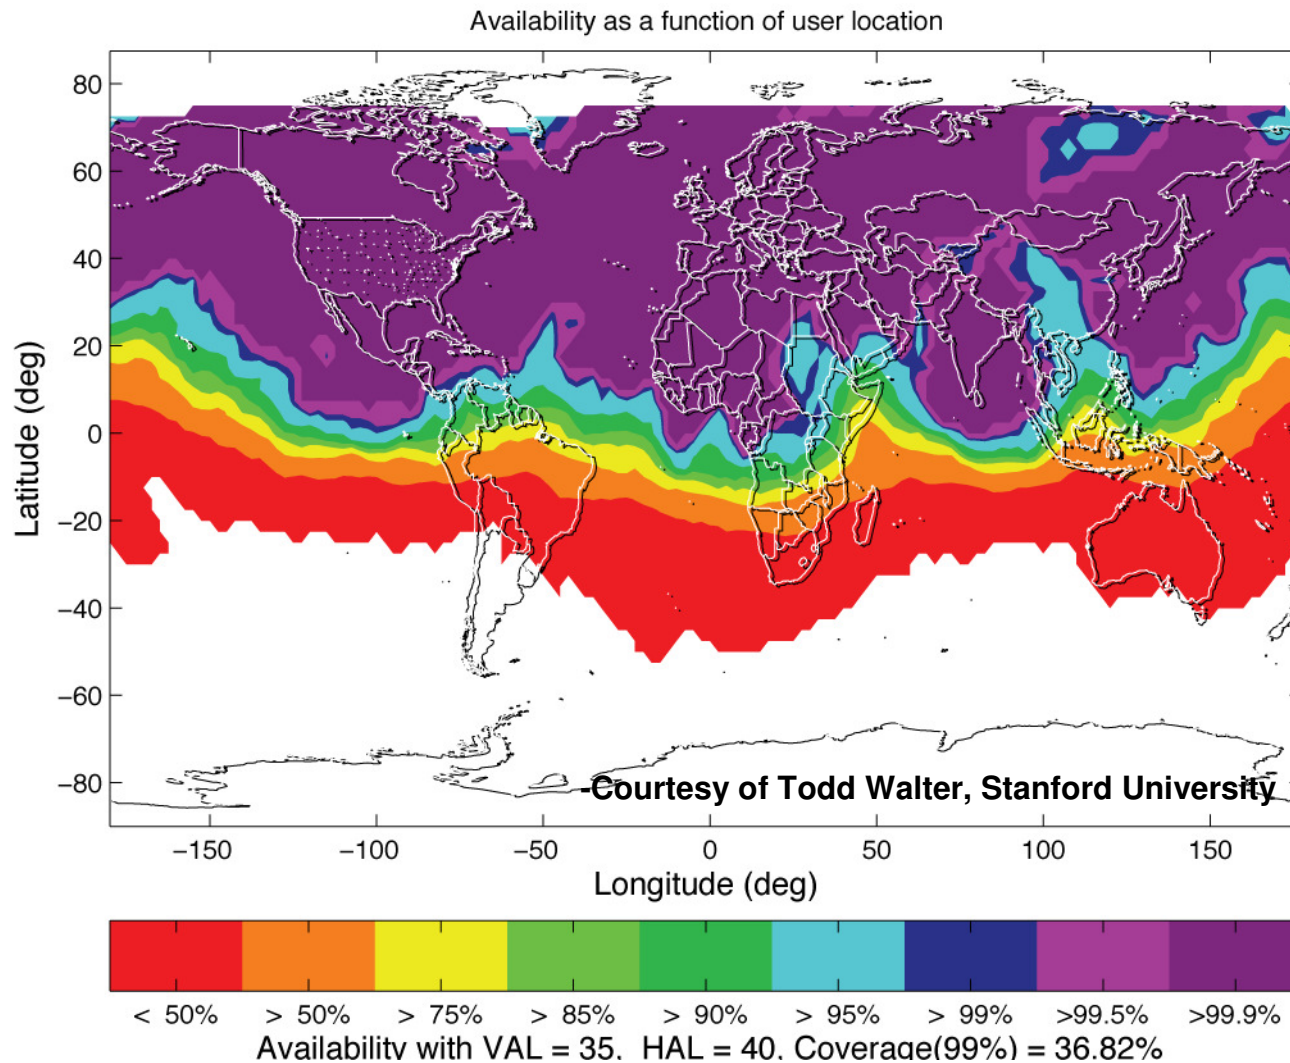

WAAS
EGNOS
MSAS

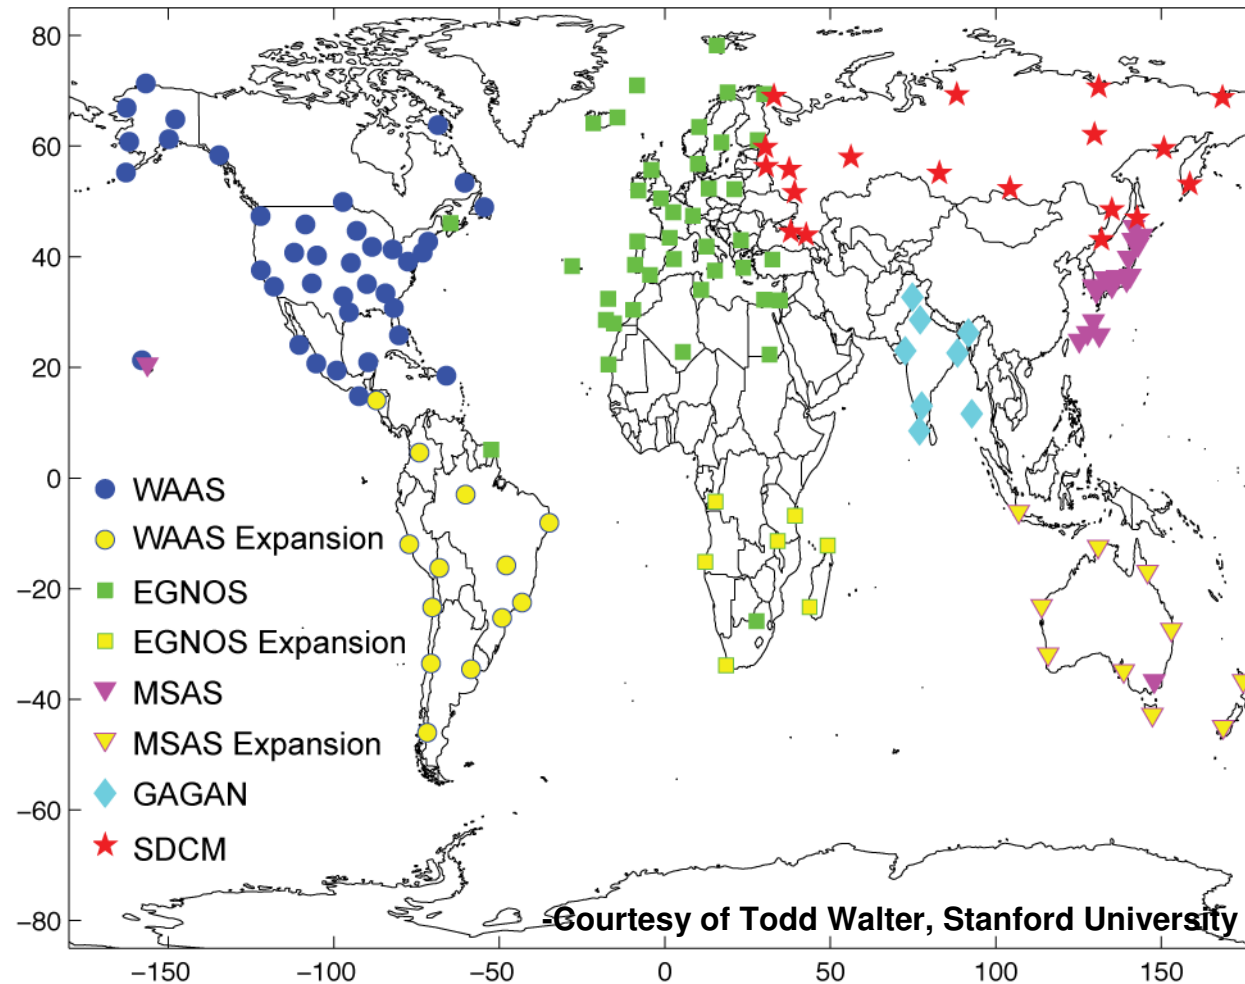

WAAS, MSAS, EGNOS, GAGAN and SDCM Reference Networks

WAAS, MSAS, EGNOS, GAGAN & SDCM (Dual Frequency GPS)

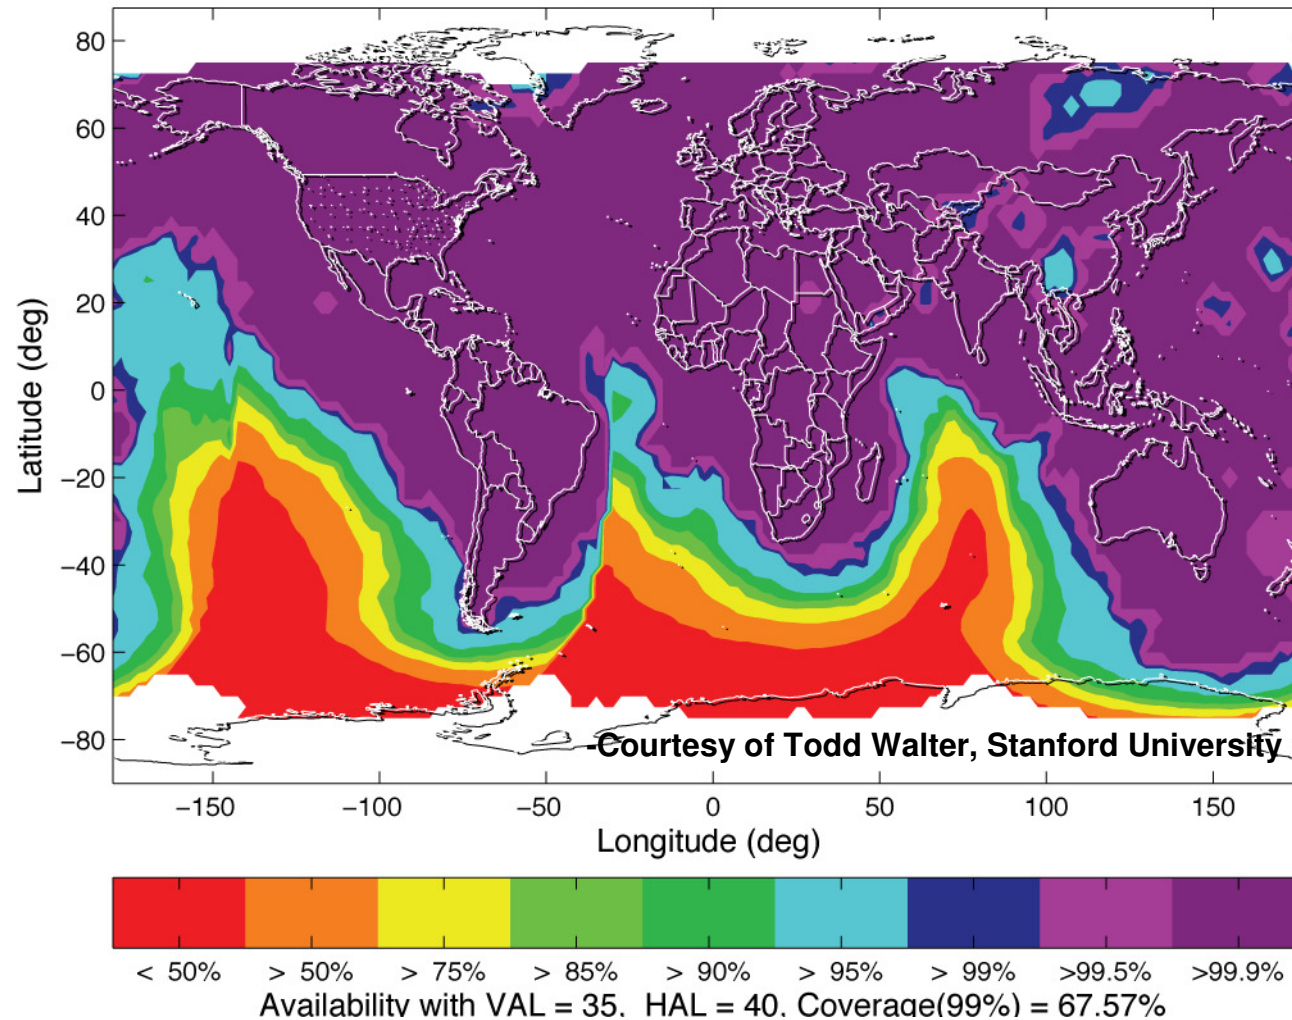

Expanded Networks

WAAS, MSAS, EGNOS, GAGAN & SDCM

(Dual Frequency GPS + Expanded Networks)

Availability as a function of user location

Objective: Worldwide Approach & Landing

Approach capability with no airport equipment.
Landing capability in all weather.

Based on Open Service.

Robust against:

- ionospheric storms
- constellation weakness
- RFI (scheduled, accidental or malevolent).
- changes in GNSS constellation performance

Aviation does not want to be brittle!

Advanced Receiver Autonomous Integrity Monitoring (ARAIM)

Advanced RAIM (ARAIM) + Integrity Support Message (ISM)

Who provides or validates the Integrity Support Message?

Worldwide Coverage for LPV-200 & ARAIM Availability of 99.5%

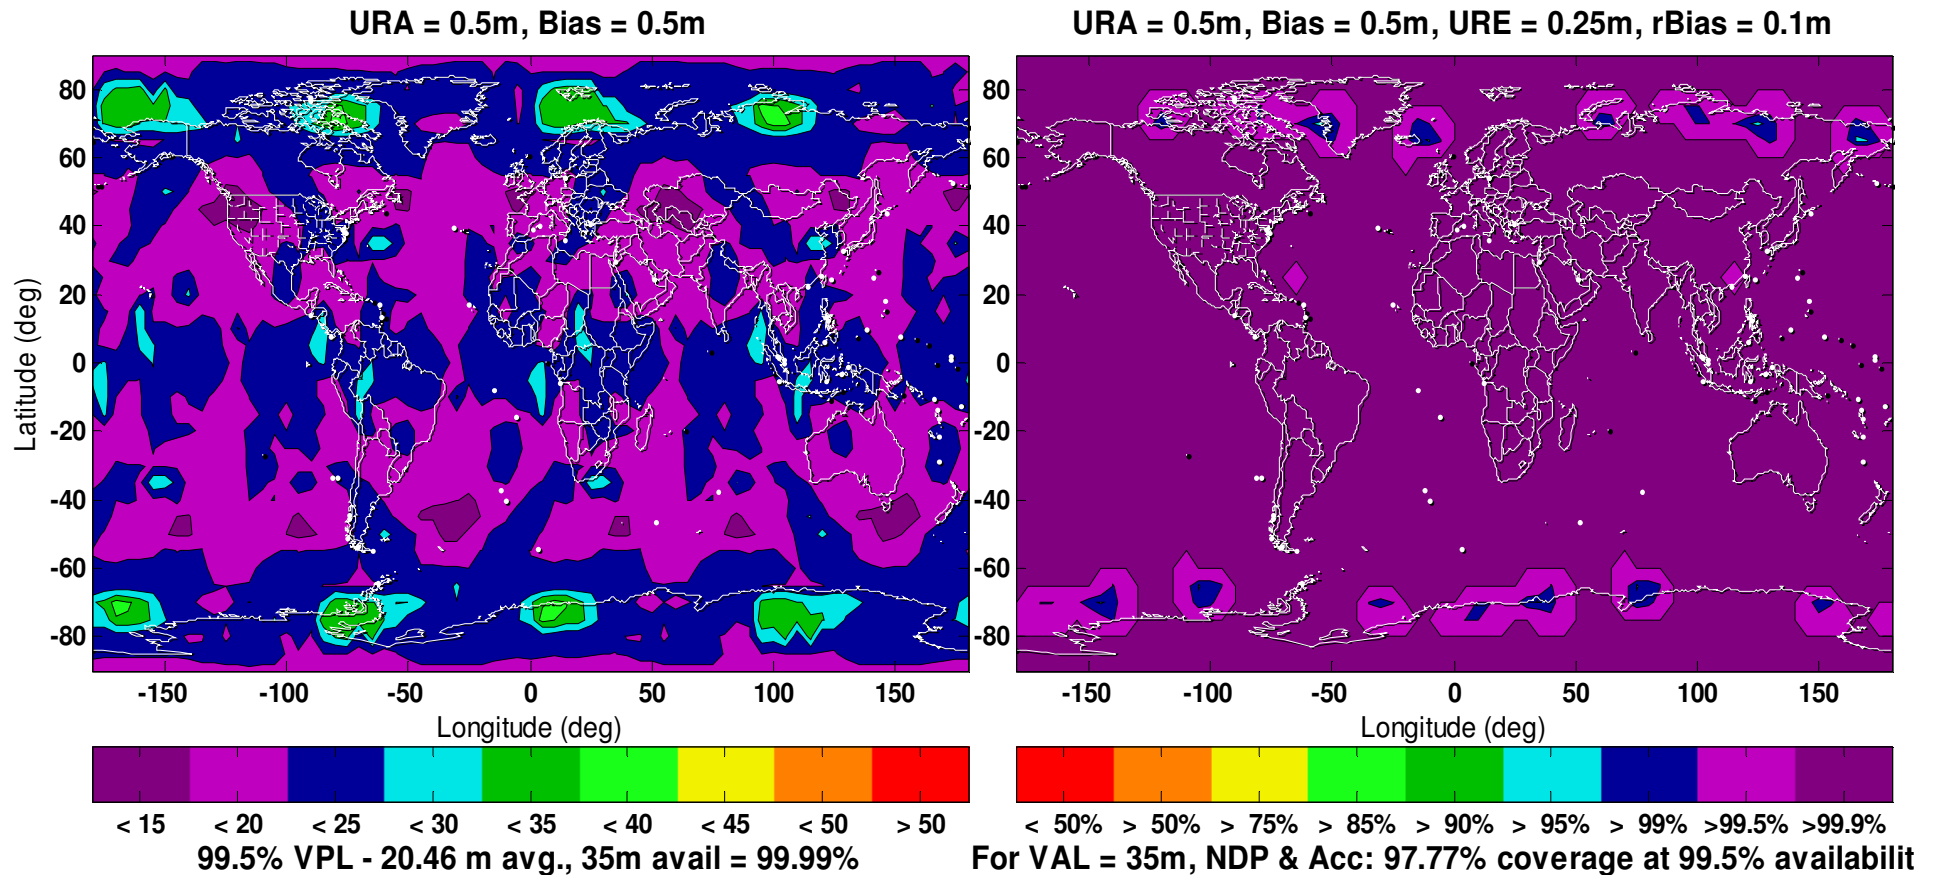

Weak Constellation: 21 GPS & 24 Galileo

failure prone satellites →

weaker satellites ↓

	10^{-5}	10^{-4}	10^{-3}	10^{-2}
URA = .5 m URE = .25 m Bias = .75 m	100%	99.8%	98.6%	57%
URA = 1 m URE = .5 m Bias = .5 m	99.8%	99.6%	97.3%	48%
URA = 2.4 m URE = 1.2 m Bias = .5 m	94.1%	76%	44.2%	0%

ARAIM Results for 30 SVs & URA = .5 m

ARAIM currently predicated upon a user update rate of ~ 1hour

Are We Done?

Functional Hazard Analysis

Minor 10⁻³	Slight increase in crew workload	
Major 10⁻⁵	Significant increase in workload, Possible injury	Lateral navigation, Non-precision approach (RAIM)
Severe Major 10⁻⁷	Unmanageable increase in workload, Possible fatality	Vertical guidance, LPV 200 (WAAS), Category I (LAAS)
Catastrophic 10⁻⁹	Multiple fatalities, Loss of aircraft	Zero visibility, Category II & III (LAAS)

Conclusions

- **Single frequency coverage is good within the countries fielding SBAS**
- **Dual frequency extends LPV coverage outside reference networks**
- **Expanding networks into southern hemisphere could allow global coverage of land masses**
- **ARAIM Potential for Multi-Constellation GNSS**
