GEOSS for Climate: Activities and achievements

Giovanni Rum
GEO Secretariat
18 March 2009

52nd Session of COPUOS
Vienna, June 2009
THE GLOBAL EARTH OBSERVATION SYSTEM OF SYSTEMS

INFORMATION FOR THE BENEFIT OF SOCIETY

Disasters  Health  Energy  Climate  Agriculture  Ecosystems
Weather  Water  Biodiversity
• The climate has impacts in each of the other eight societal benefit areas.
• Coping with climate change and variability demands good scientific understanding based on sufficient and reliable observations.
• GEOSS outcomes will enhance the capacity to model, mitigate, and adapt to climate change and variability.
• Better understanding of the climate and its impacts on the Earth system, including its human and economic aspects, will contribute to improved climate prediction and facilitate sustainable development while avoiding dangerous perturbations to the climate system. (GEOSS 10-Year Implementation Plan)
Expected Benefits

Climate observations, modelling and data sets

- **Essential to and supports all SBAs**
  - Vast range of user communities

- **Support adaptation and mitigation under UNFCCC**

- **Support to IPCC assessments**

- **Climate information as a global public good**
  - Data Sharing Principles with open access

- **Support science and research community**
  - Including modellers
Climate Change Adaptation: The Cross-cutting Dimension of GEOSS
Fighting Emerging Diseases
Defining Energy Policies

- Agriculture

- Weather
- Biodiversity
- Climate
Reducing Impact of Disasters
GEOSS Climate Tasks

• A Climate Record for Assessing Variability and Change
  – Sustained Reprocessing and Reanalysis of Climate Data
  – Extending the Record of Climate Variability at Global Scale
  – Key Climate Data from Satellite Systems

• Environmental Information for Decision-making, Risk Management and Adaptation
  – Towards Enhanced Climate, Weather, Water and Environmental Prediction
  – Climate Information for Decision-making, Risk Management and Adaptation

• Global Carbon Observation and Analysis System
  – Integrated Global Carbon Observation
  – Forest Carbon Tracking
  – Global Monitoring of Greenhouse Gases from Space

• Sustained Observing Systems
  – Global Terrestrial Observations for Climate
  – Legacy of the International Polar Year
  – Global Ocean Observation System
  – Global Observing System (GOS)
A Climate Record for Assessing Variability and Change

- Extend and improve the quality of the past climate record through advanced data reanalysis and reconstruction in the atmosphere, ocean, land and sea ice domains.

- Generate high-quality temporally-homogeneous estimates of the past climate to support analyses of climate variability and change.

Sub-Tasks

- Sustained Reprocessing and Reanalysis of Climate Data
- Extending the Record of Climate Variability at Global Scale
- Key Climate Data from Satellite Systems
Environmental Information for Decision-making, Risk Management and Adaptation

- Support the integration of climate and environmental risk management into adaptation processes.
- Coordinate and drive the development of tailored climate products and services.
- Encourage the use of this information by policy and decision makers (at all levels), and initiate user-oriented activities to do both increase the demand, and foster the supply, of climate and environmental services for development.

Sub-Tasks

• Towards Enhanced Climate, Weather, Water and Environmental Prediction
• Climate Information for Decision-making, Risk Management and Adaptation
Global Carbon Observation and Analysis System

- Implement a global carbon observation and analysis system addressing the three components of the carbon cycle (atmosphere, land and ocean).
- Develop robust tools and methodologies for high-precision CO2 measurements and carbon storage evaluation.

Sub-Tasks

• Integrated Global Carbon Observation (IGCO)
• Forest Carbon Tracking
• Global Monitoring of Greenhouse Gases from Space
Sustained Observing Systems

- Establish actions for the maintenance and expansion of observing systems for climate and weather, including terrestrial, oceanic, air-borne and space-based.
- Promote stable, reliable and long-term operations of climate and weather observing networks.
- In particular, accelerate the implementation of the Global Climate Observing System (GCOS) in line with the “Implementation Plan for the Global Observing System for Climate in Support of the UNFCCC”.

Sub-Tasks
- Key Terrestrial Observations for Climate
- Legacy of the International Polar Year 2007-08
- Global Ocean Observation System
- Global Observing System (GOS)
Environment and Climate Change

To respond to the growing demand for Earth observation data, we will accelerate efforts within the Global Earth Observation System of Systems (GEOSS), which builds on the work of UN specialized agencies and programs, in priority areas, inter alia, climate change and water resources management, by strengthening observation, prediction and data sharing. We also support capacity building for developing countries in earth observations and promote interoperability and linkage with other partners.
2009 Key Climate Events

- Expert Meeting on Updating the GCOS Implementation Plan: Feb 2-5
- 3rd GEOSS Asia-Pacific Symposium: Feb 4-6
- WMO EC Working Group on Climate and Environmental Matters: Feb 11-13
- Joint IPCC-WCRP-IGBP Workshop: New Science Directions and Activities relevant to the IPCC AR5: March 3-6
- World Water Forum: March 16-22
- Closure Meeting on the 2009 GCOS Progress Report: Mar 19-20
- Thirtieth session of the WCRP Joint Scientific Committee (JSC), Apr 6-9
- 33rd International Symposium on Remote Sensing of Environment: May 4-8
- The WMO/GEO/WCRP IPY Legacy Workshop on Sustaining Projects’ Contributions to WMO Global Cryosphere Watch and GEOSS: May 2009
- GEOSS Forest symposium: July 1-3
- International Geoscience & Remote Sensing Symposium, IGARSS 09: July 13-17
- OceanObs'09 Ocean Information for Society: Sustaining the Benefits, Realizing the Potential: Sept 21-25
- WCC: Aug 31-Sept 4
- GEO-VI Plenary: Nov 17-18
- COP-16: Nov 30-11 Dec
GEOSS Climate Achievements
Ozone Climate Data Records

- **SBUV/2 data**
  - NOAA-16 SBUV/2 (2004 to 2007)
  - NOAA-17 SBUV/2 (2003 to 2007)

- Reprocessed with the latest instrument characterization and calibration

- Extend the previously released Ozone Climate Data Record (1979 to 2003) from SBUV(/2) instruments by four years.

**Significance:** The SBUV(/2) ozone CDR’s are used to determine and monitor atmospheric ozone trends and variations. These are compared to models and other results in creating the international ozone assessments. The latest report is available at: [www.esrl.noaa.gov/csd/assessments/2006/](http://www.esrl.noaa.gov/csd/assessments/2006/)

*Figure from V. Fioletov et al. at the 2008 Quadrennial Ozone Symposium in Tromso Norway showing deseasonalized global mean ozone time series from SBUV(/2) and other sources.*

*Figure from NOAA’s 2007 S.Hemisphere Winter Summary showing total ozone anomalies versus time and latitude.* [www.cpc.ncep.noaa.gov/products/stratosphere/winter_bulletins](http://www.cpc.ncep.noaa.gov/products/stratosphere/winter_bulletins)
International Polar Year
Arctic and Antarctic products

• Real-time and historical satellite products (1981 to present) from AVHRR are available in support of the International Polar Year (IPY)

• **Real-time** products being generated at direct readout sites in the Arctic and Antarctic include:

  • Atmospheric products:
    - polar winds, cloud fraction, cloud phase, cloud top pressure, cloud optical depth and cloud particle size

  • Surface products:
    - ice/snow surface temperature and albedo, snow cover, sea ice cover, concentration, motion, and thickness/age.

**Significance:** This unique suite of real-time and historical satellite products will provide data for meteorological and climatological studies, and will be part of the IPY legacy.

*Project Lead: Jeff Key*
Water, Rain Rates and Snow Cover Products

- The Special Sensor Microwave/Imager (SSM/I) monthly products was extended to twenty-one years (July 1987 – June 2008).

- Products include rainfall rate, snow cover, and total precipitable water. Data is available from NCDC.

- Rainfall rates are used by the international Global Precipitation Climatology Project (GPCP).

- Future work includes reprocessing entire record using improved satellite intercalibration.

**Significance:** The extended time series of SSM/I products allows us to more accurately monitor and detect change in the amount and pattern of climatically important surface and atmospheric processes such as rainfall.

*Project Lead: Ralph Ferraro*
• Since 1998, Meteosat satellites of the First Generation (Meteosat 5 – Meteosat 7) are placed over the Indian Ocean.
• EUMETSAT processed the whole Meteosat 5 period and completed the generation the Surface Radiation Product MVIRI for IODC Service (1998-2006, Meteosat-5).
• The picture shows the first 10 day composite product from 1998.

Significance: Filling a data gap of observations from the pre-MODIS era

Project Lead: Leo van de Berg, Yves Govaerts EUMETSAT
Extend long-term time series of AVHRR
Clouds, Aerosol, Surface temperature, Vegetation index

• AVHRR data from 2006 – July 2008 was reprocessed
• This extends the AVHRR Pathfinder Atmospheres Extended (PATMOS-x) data-record from September 1981 – July 2008.
• Products include clouds, land and sea surface temperatures, aerosols and vegetation index.

Significance: Provides the longest satellite record of clouds, aerosols and surface temperatures for climate studies.

Cloud anomaly over Brazil in 2007
Climatologically significant low cloud amounts may be due to excessive agricultural burnings in response to higher demands of biofuels

Project Lead: Andrew Heidinger
GlobCarbon and GlobColour
Global datasets & accessibility

GlobColour:
- Ten year dataset (1997 – 2007)
- Derived from MODIS, MERIS, SeaWifs
- www.globcolour.info

GlobCarbon:
- 9 years available
- derived from SPOT-4, SPOT-5, ATSR-2, AATSR and MERIS
- consists of land products such as Burn Scar, Leaf Area Index, fraction of absorbed photosynthetically active radiation (fAPAR), and vegetation growth cycle.
- http://dup.esrin.esa.int/ionia/globcarbon/products.asp

Significance: Provides essential datasets for carbon surface/air exchange studies and carbon modeling.
Wall-to wall Forest Carbon Monitoring

Four key outcomes expected:

- **Data and processing**
  - Affordable, continuous, accessible supply of mid-resolution satellite data, both optical and radar, supported by processing to relevant forest cover information (areas of deforestation and degradation)

- **Interoperability**
  - Both optical and radar instruments must be used, on a “fit-for-purpose” basis, and interoperability is crucial to achieve the goals

- **Linking remote sensing to emissions estimation**
  - Methods and protocols for this linking should be standardised to the extent that users can presume robustness in technical applications

- **Validation procedures**
  - Protocols and practices for validation need to be developed so that users can presume consistency and accuracy in standards derived
Forest and Carbon Monitoring

CEOS communiqué

- Agreement among CEOS Member agencies
- Ensure availability of current and future data supply
- Adequate for the implementation and operation of continuous services
- Documented procedures to secure interoperability of optical and SAR sensors based on case study results

Progress and demonstration of results

- For GEO-VI and COP-15
- Making clear the capacity of these initiatives to support policy objectives
