

SPACE SECURITY INDEX

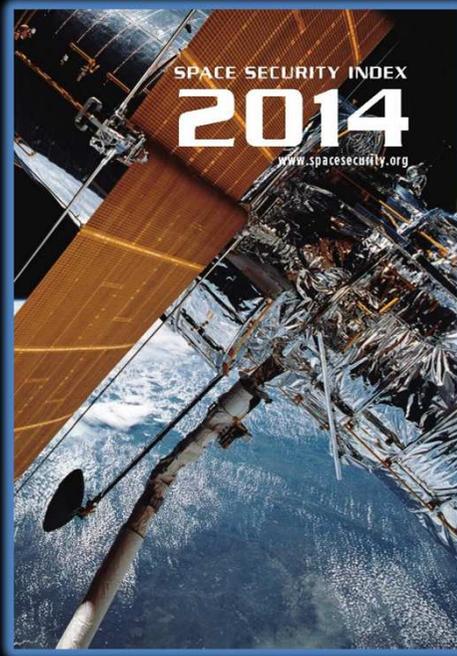

Committee on the Peaceful Uses of Outer Space

Vienna, 17 June 2014

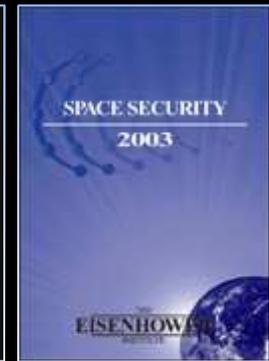

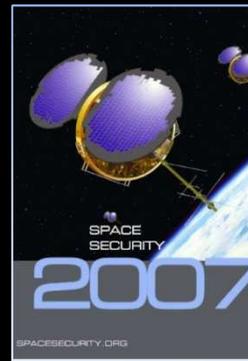

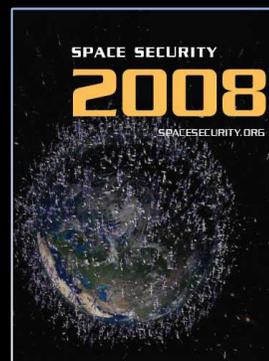

Cesar Jaramillo - SSI Project Manager

The Space Security Index

- Provides objective and fact-based research to promote *transparency and confidence* in space activities
- Supports the development of *policy* to ensure secure access to space for all

“The secure and sustainable access to and use of space, and freedom from space-based threats”

- **Theme 1:** Condition of the space environment
- **Theme 2:** Access to and use of space by various actors
- **Theme 3:** Security of space systems
- **Theme 4:** Outer space policies and governance

Condition of the space environment

Theme 1: Condition of the space environment

- *Indicator 1.1: Orbital debris*
- *Indicator 1.2: Radio frequency (RF) spectrum and orbital positions*
- *Indicator 1.3: Near-Earth Objects*
- *Indicator 1.4: Space situational awareness*

Condition of the Space Environment

- **Key challenge: Indiscriminate threat posed by space debris to spacecraft of all nations**
- **Difficulties inherent in Active Debris Removal**
- **Awareness of the space debris problem has increased considerably**
- **Greater willingness to share space situational awareness data through international partnerships**

Access to and use of space by various actors

Theme 2: Access to and use of space by various actors

- *Indicator 2.1: Space-based global utilities*
- *Indicator 2.2: Priorities and funding levels in civil space programs*
- *Indicator 2.3: International cooperation in space activities*
- *Indicator 2.4: Growth in commercial space industry*
- *Indicator 2.5: Public-private collaboration on space activities*
- *Indicator 2.6: Space-based military systems*

Number and diversity of space actors

- ***Access*** to outer space is growing
 - ***New space actors*** emerging
 - Barriers to entry are sharply **decreasing**
-
- **But:** Limited resources (e.g. orbital slots, RF spectrum)

Access to and use of space by various actors

- Limited nature of some space resources will pose governance challenges to ensure equitable access for newcomers
- International cooperation assists in the transfer of expertise and technology for the access to, and use of space, by emerging space actors
- A healthy space industry can lead to decreasing costs for space access and use, and may increase the accessibility of space technology for a wider range of space actors
- Military space sector has been an important driver in the advancement of capabilities to access and use space, but may be source of friction

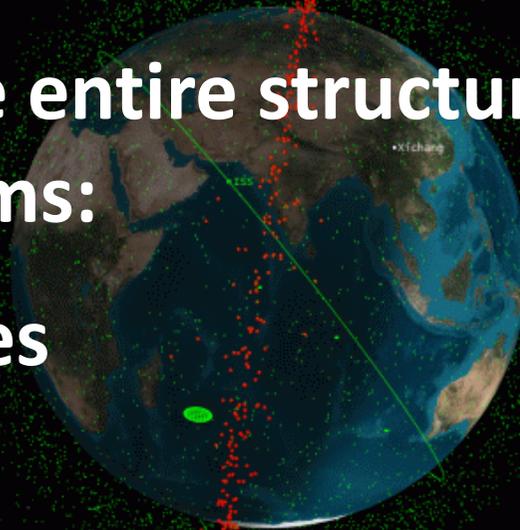

Theme 3: Security of space systems

- *Indicator 3.1: Vulnerability of satellite communications, broadcast links, and ground stations*
- *Indicator 3.2: Protection of satellites against direct threats*
- *Indicator 3.3: Capacity to rebuild space systems and integrate smaller satellites into space operations*
- *Indicator 3.4: Earth-based capabilities to attack satellites*
- *Indicator 3.5: Space-based negation enabling capabilities*

- **Offensive/Defensive space capabilities are NOT ONLY related to systems in orbit**

- **They include the entire structure of space and terrestrial systems:**
 - **Orbiting satellites**
 - **Ground stations**
 - **Data and communications links**

- The dynamics of space systems protection and negation are closely related and, under some conditions, protective measures can motivate adversaries to develop the capabilities to overcome them
- While no hostile anti-satellite (ASAT) attacks have been carried out, recent incidents testify to the availability and effectiveness of ground-based systems to destroy satellites

In the past decade alone:

- ground-based anti-satellite weapons (ASATs) have been tested,
- several communications satellites have been deliberately jammed;
- missile defense systems have been used as ASATs;
- precursor technologies that would allow space-to-space offensive capabilities have been developed

Outer space policies and governance

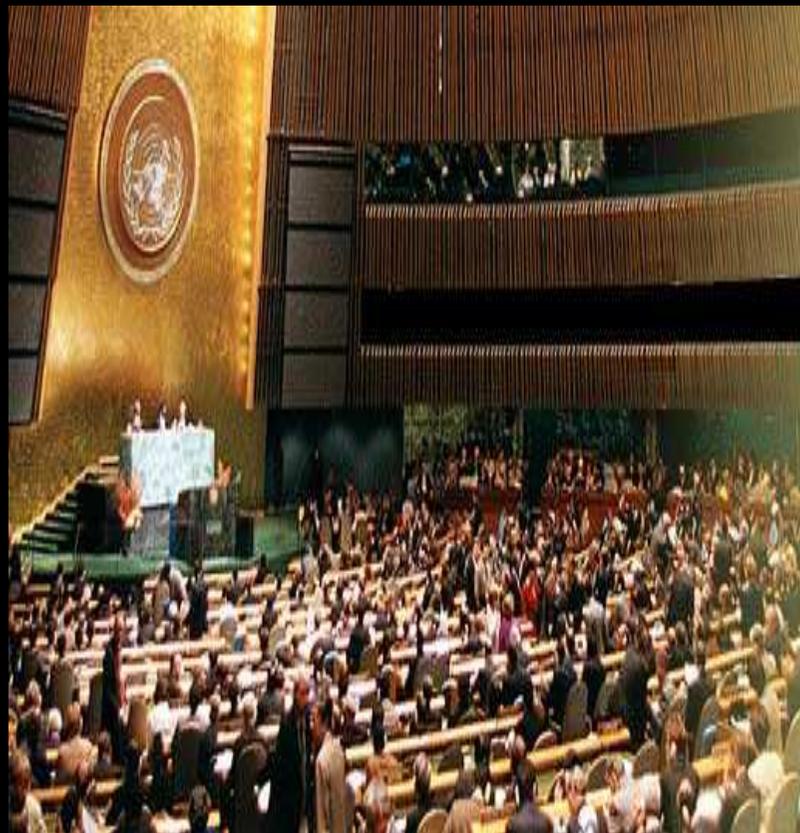

Theme 4: Outer space policies and governance

- *Indicator 4.1: National space policies and laws*
- *Indicator 4.2: Multilateral forums for space governance*
- *Indicator 4.3: Other initiatives*

Outer space policies and governance

Laws, Policies, and Doctrines

Existing normative architecture for space activities is *insufficient*

Different Approaches:

- National vs. Multilateral
- Legally- vs. politically-binding
- Not necessarily mutually exclusive

Key proposals:

- **Int'l Code of Conduct for Outer Space Activities**
- **PPWT**
- **Canada's proposed pledges not to:**
 - a. Place weapons in space,
 - b. Test or use weapons on satellites so as to damage or destroy them, and
 - c. Use satellites themselves as weapons.

- International space actors have been unable to reach consensus on the exact nature of a space security regime and issues to be covered by an updated normative regime for outer space
- Current alternatives for consideration include both **legally binding** treaties (such as PPWT) and **politically binding** norms of behavior (such as ICoC)
- Establishment of GGE on TCBMs and LTSSA Working Group widely seen as positive developments
- Deadlock at CD continues
