Salzburg

Themes

- 1. Digital Earth Initiative**
- 2. Renewable Energy in Regions**

Global Perspective – Local Action

ZGIS

Digital Earth

Digital Earth is a visionary concept for the virtual representation of the Earth that is spatially referenced and interconnected with digital knowledge archives from around the planet with vast amounts of scientific, natural, and cultural information to describe and understand the Earth and human activities. This vision states that any citizen of the planet, linked through the Internet, should be able to access this virtual world for free.

www.isde5.org

Digital Earth

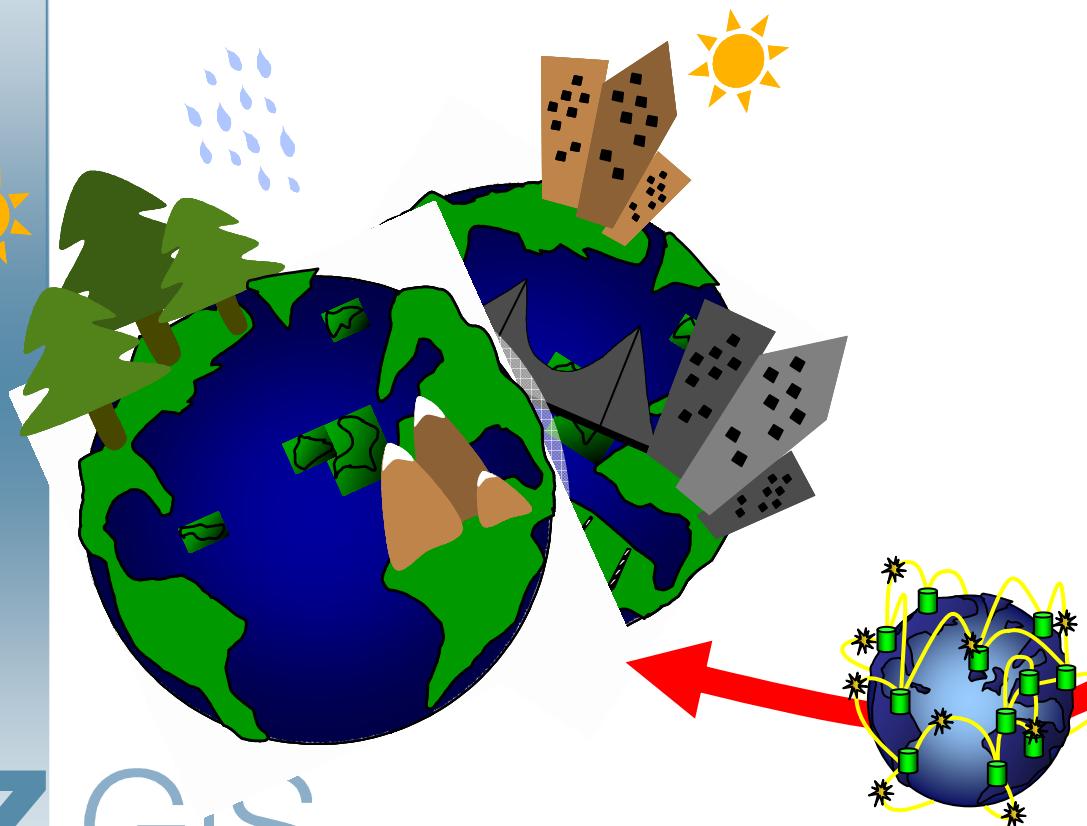

- **Largely based on Remote Sensing**
- **A Global Monitoring Framework**
 - plus modeling and simulation
- **,Big Picture‘; Systems view**
- **Providing Context for Sustainable Development**

Universität

Salzburg

“System Earth”

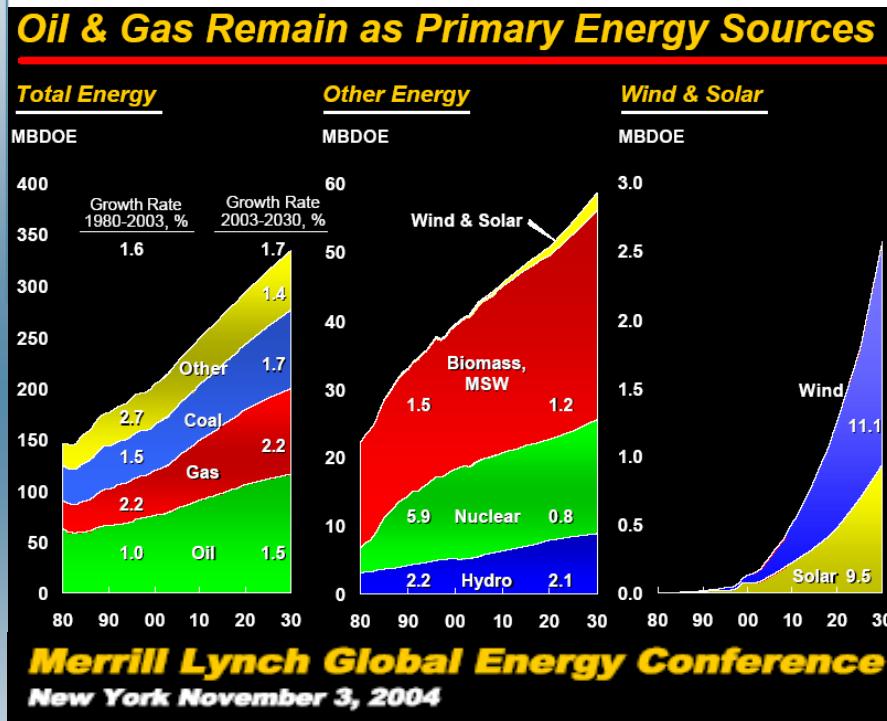

- **Representation**
- **Understanding**
- **Management**
- **Communication**

... Geographic Information Science

ZGIS

“Supplying energy to a growing world population while reducing greenhouse gas emissions is one of the grand challenges that we humans must face in this century” Global Climate & Energy Project, Stanford University

“The world consumes two barrels of oil for every barrel discovered. So is this something you should be worried about ?”

Chevron Corporation

Main triggers

- **Cost for fossile fuels is going up (shrinking reserves are *one* factor in this)**
- **Growing awareness of political dependence; better look for *local* sustainability**

Hypotheses

- **Sustainable supply of energy is a local responsibility = distributed generation**
- **Temporal balancing is more challenging than totals**
- **Grid: from long-range transmission to intra- und inter-regional balancing**

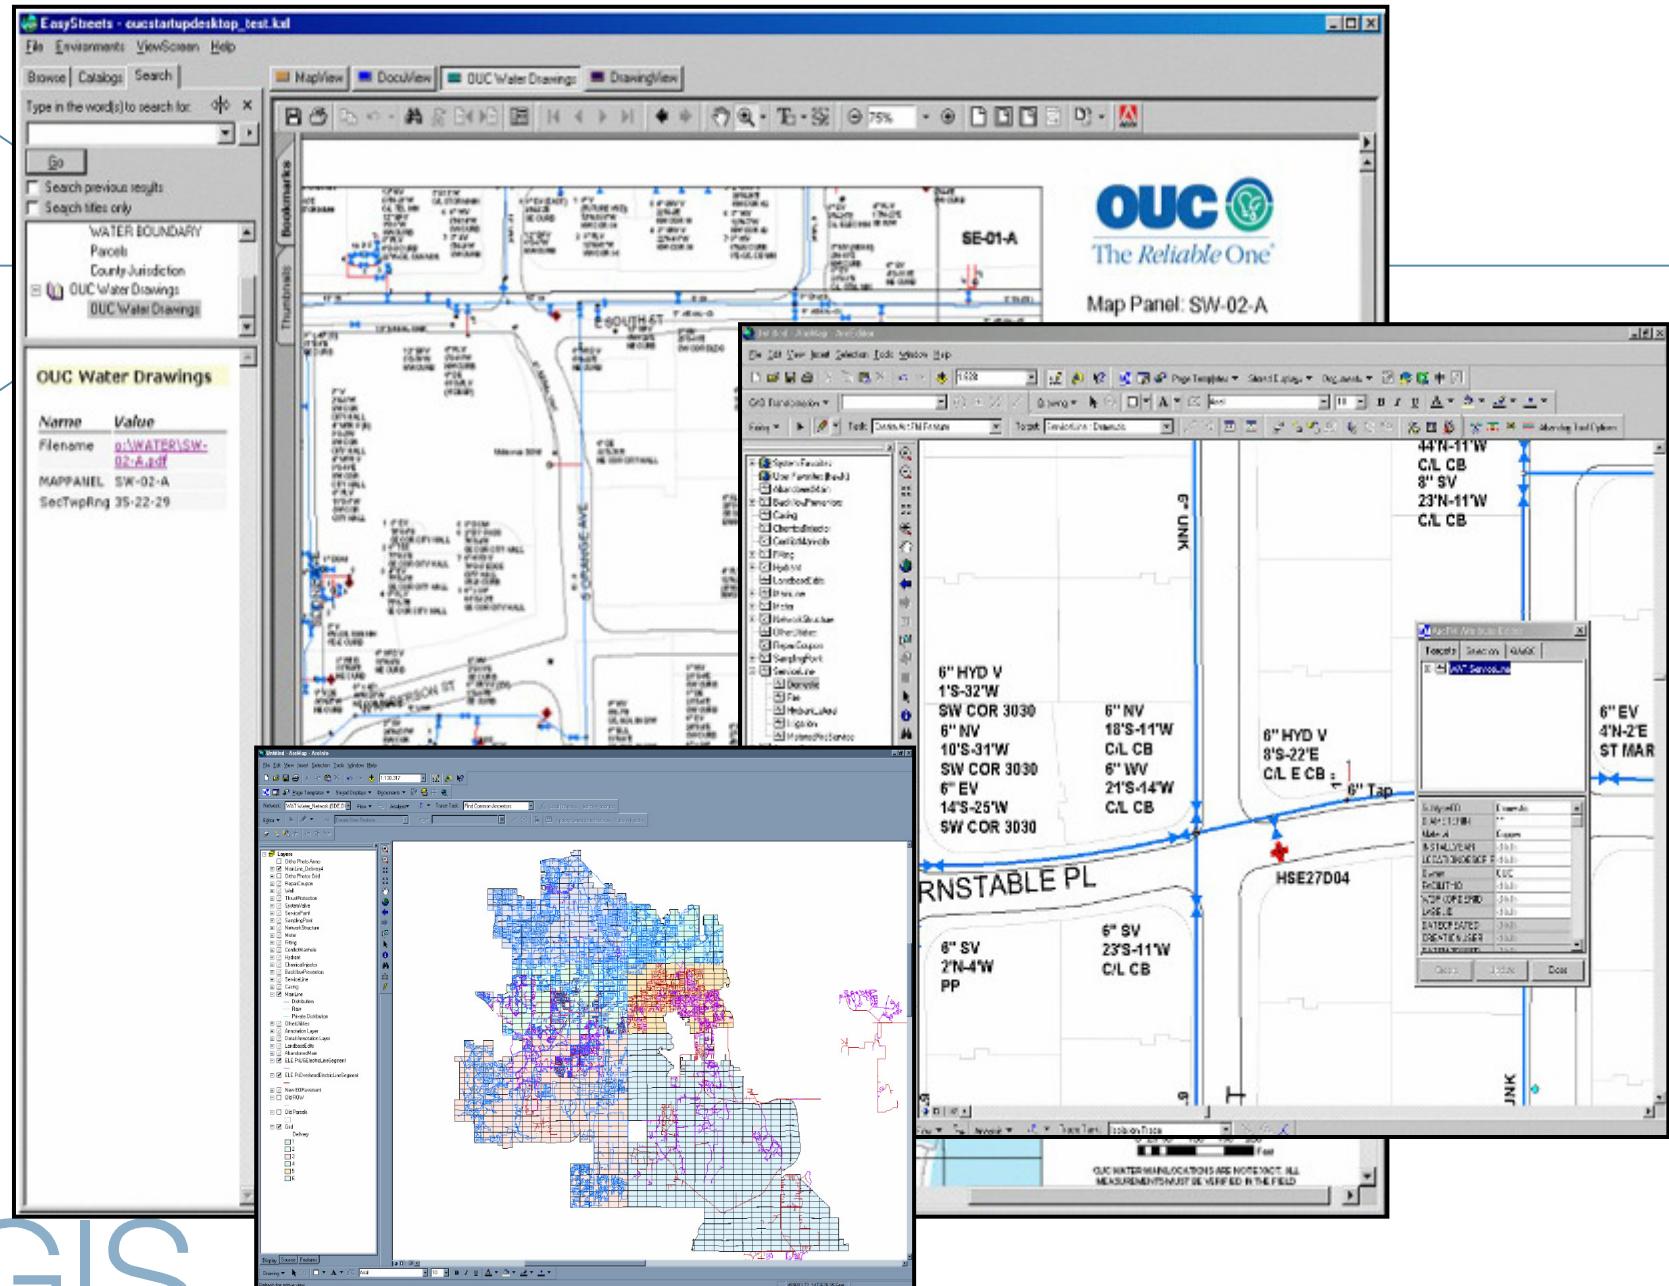

Focus on ...

- **Electricity**
- ***not:* heat, mobility**
- **(while acknowledging that there are substantial synergies, substitutions and complementarities)**

Energy Industry

- **GIS used to be (and still is)**
 - a tool for asset documentation
 - a tool for distribution network planning
- **GIS is going to be**
 - a strategic enterprise level tool for
 1. planning generation from renewable sources, and
 2. managing liberalized / unbundled enterprises

ZENTRUM FÜR GEOINFORMATIK SALZBURG

CENTRE FOR GEOINFORMATICS SALZBURG

Energy and Geography?

- Trend from fossile to renewable fuels
- Renewables are directly or indirectly generated from solar radiation
- Therefore substantial amounts of land are needed!
- Sensitivity to transport and storage
- Market liberalisation: Geography turns from 'constant' to 'variable'

Production of renewable Energy is ‚geographic‘

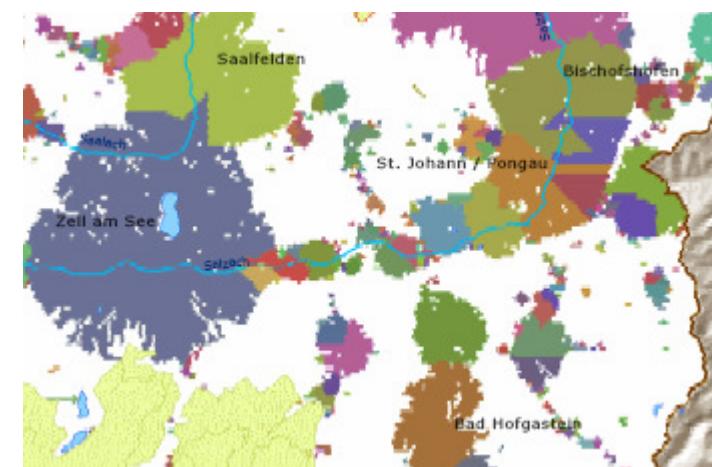

because of

- Direct or indirect ‚Solar‘ production requiring large areas
- Sensitivity to transport and storage
- Market liberalisation: Geography turns from ‚constant‘ to ‚variable‘

Energy Production

**... is increasingly becoming a spatial
planning / zoning issue!**

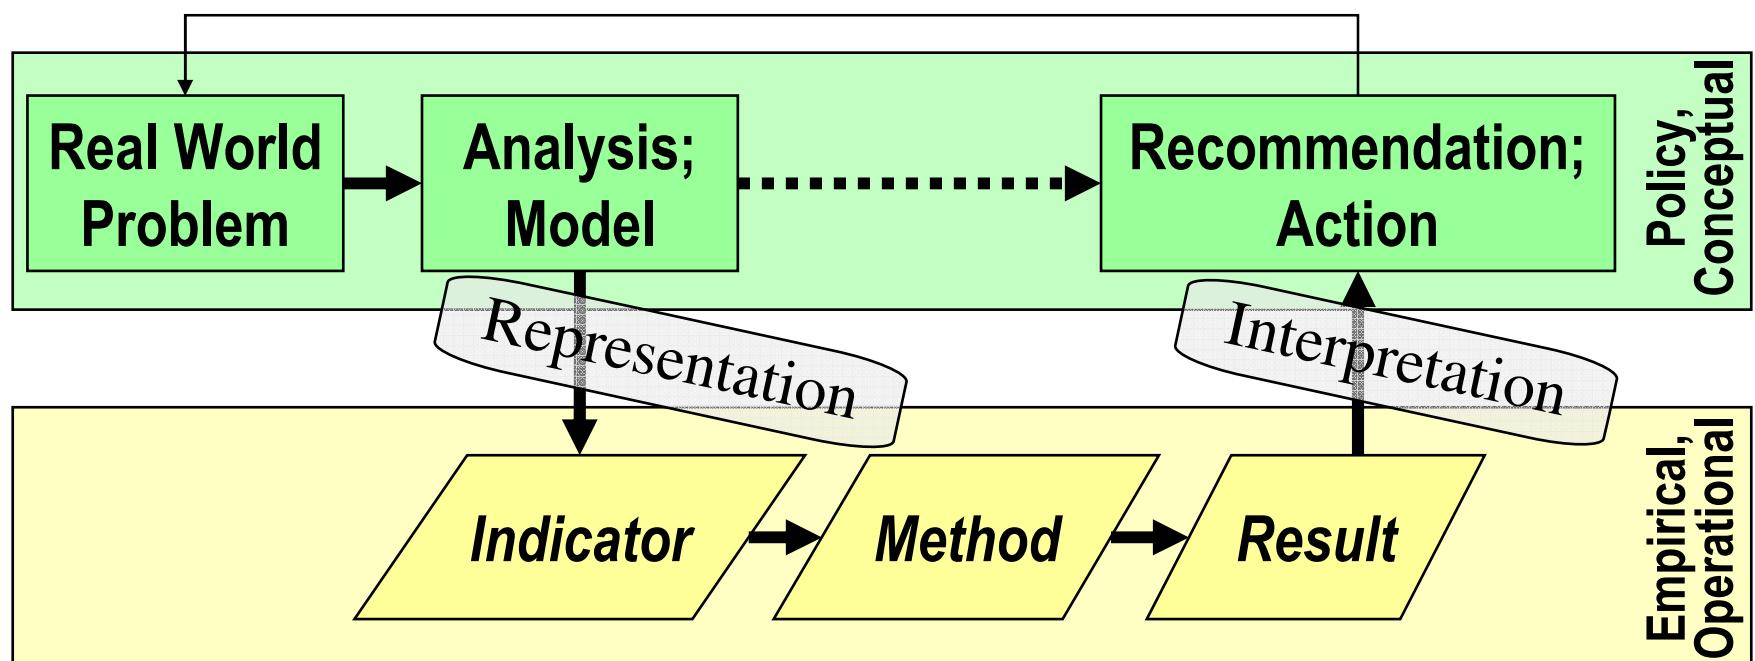

Renewables

- **Photovoltaic and Solar thermal**
- **Wind energy**
- **Tidal power**
- **Hydropower**
- **Biomass (excl. biofuels)**
- **Geothermal**

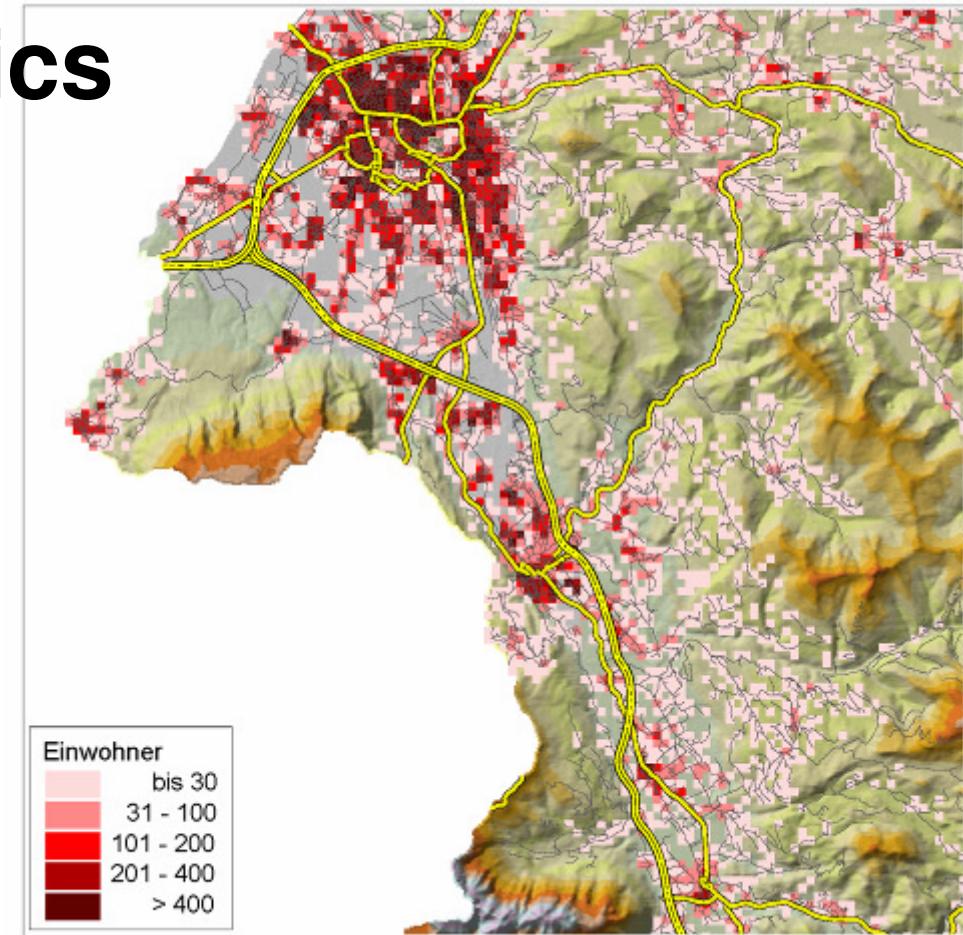

Spatial Indicators

Operational Metrics for the Real World:

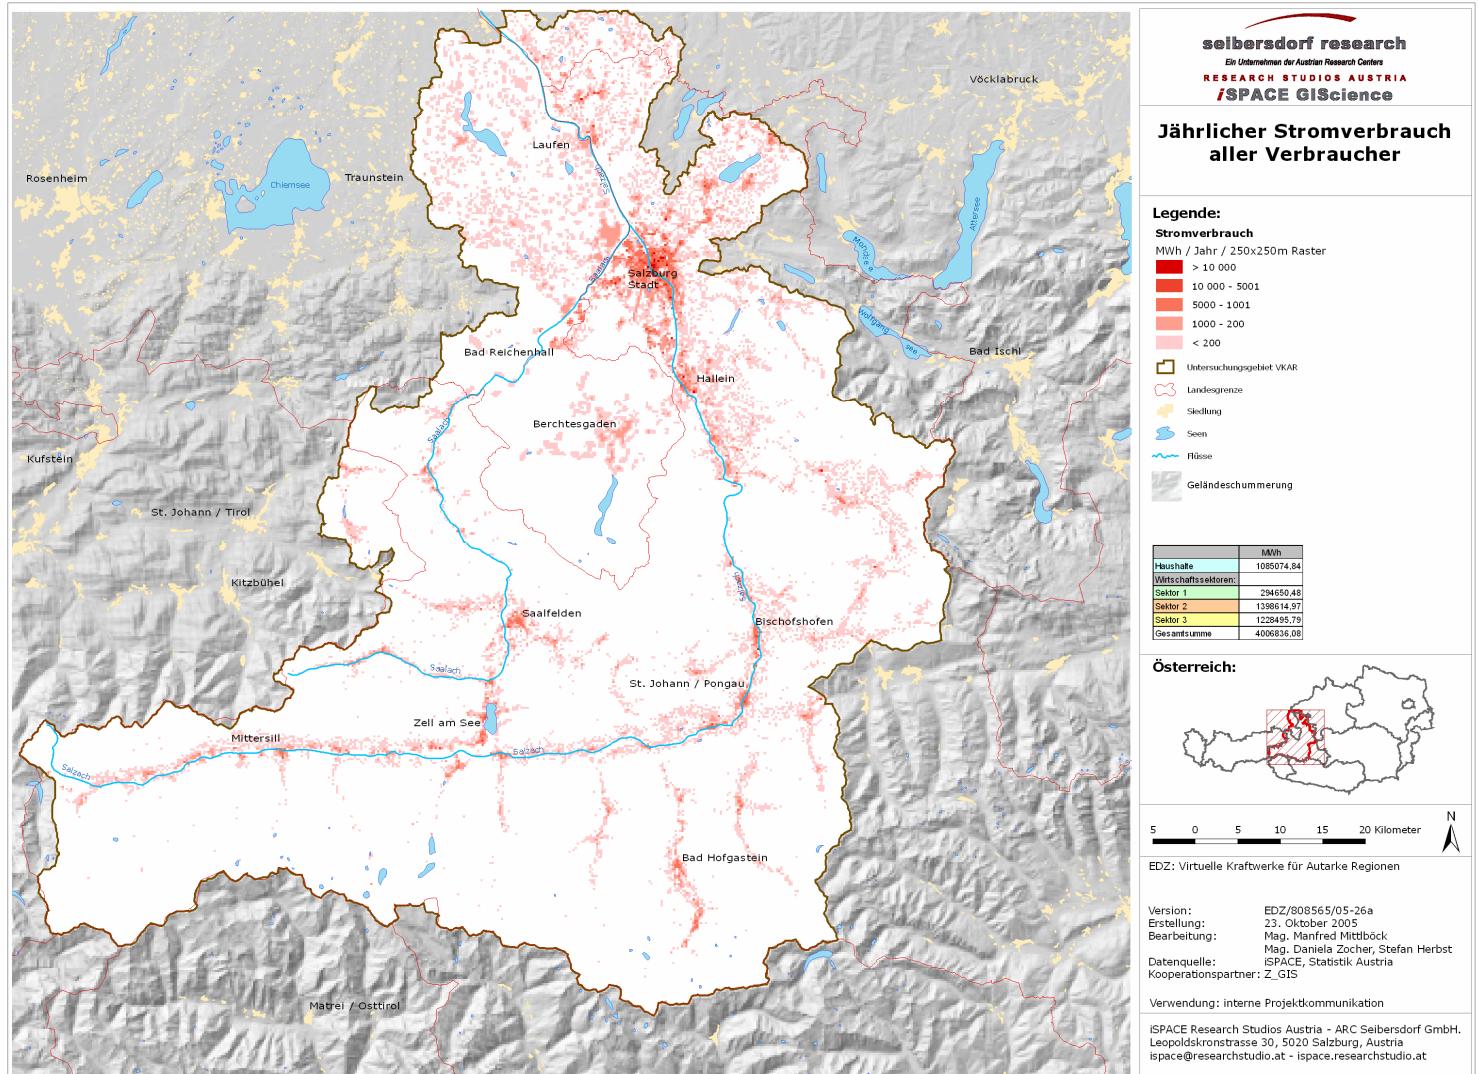

Demand indicators

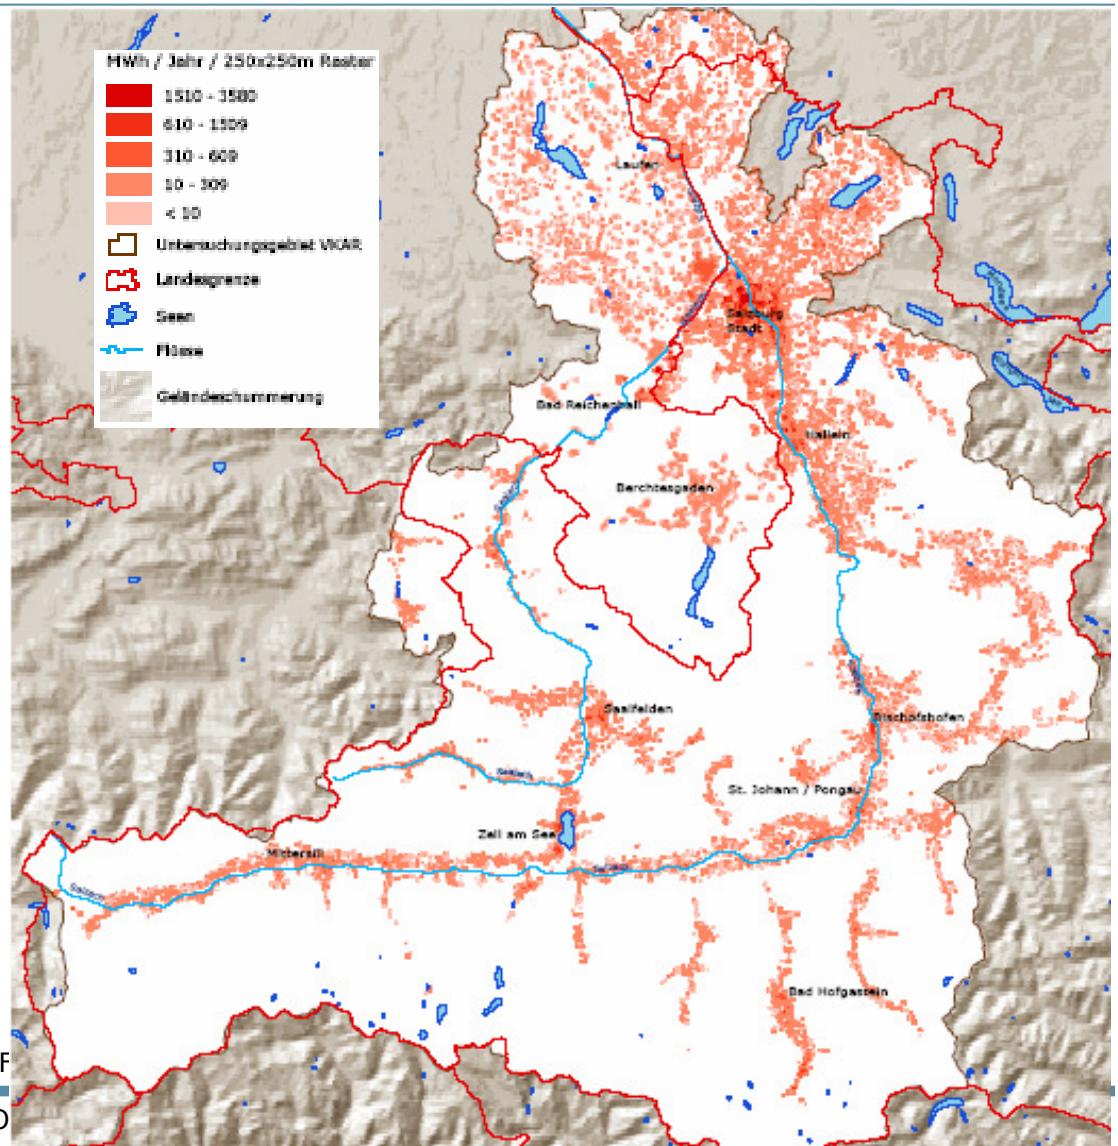

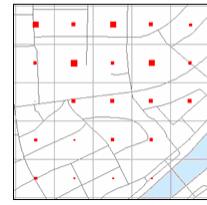

- Demographics
- Business data
- ...

Demand / Load Modeling

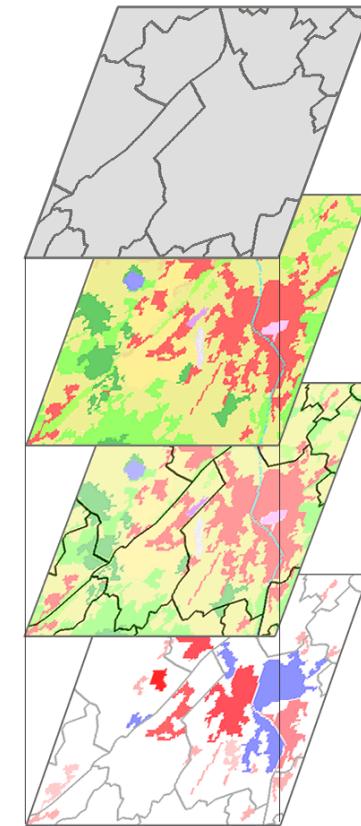

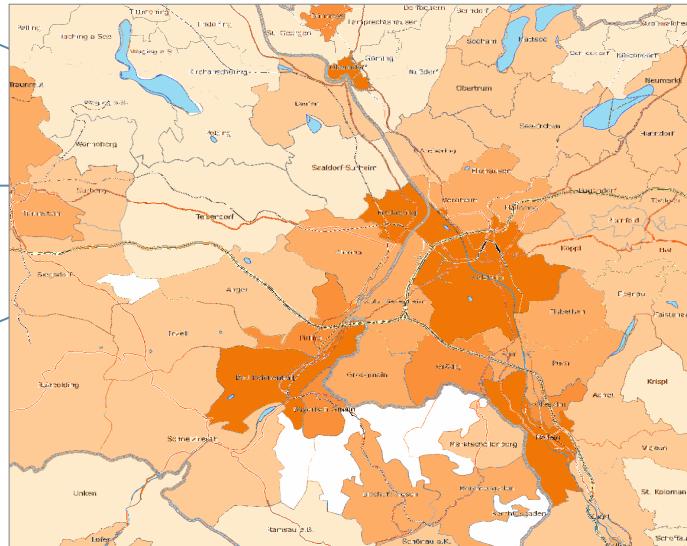

Demand from Households (~1 TWh/yr)

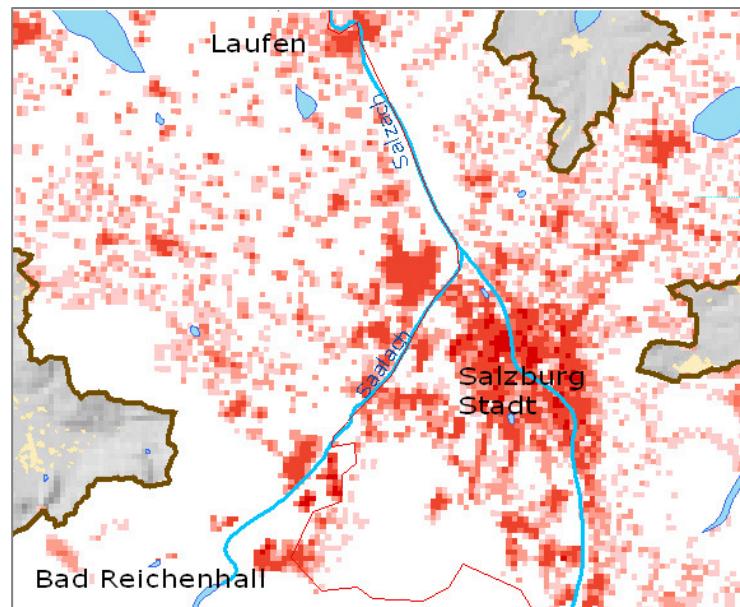

Universität
Salzburg

Admin. Grenzen

Landnutzung

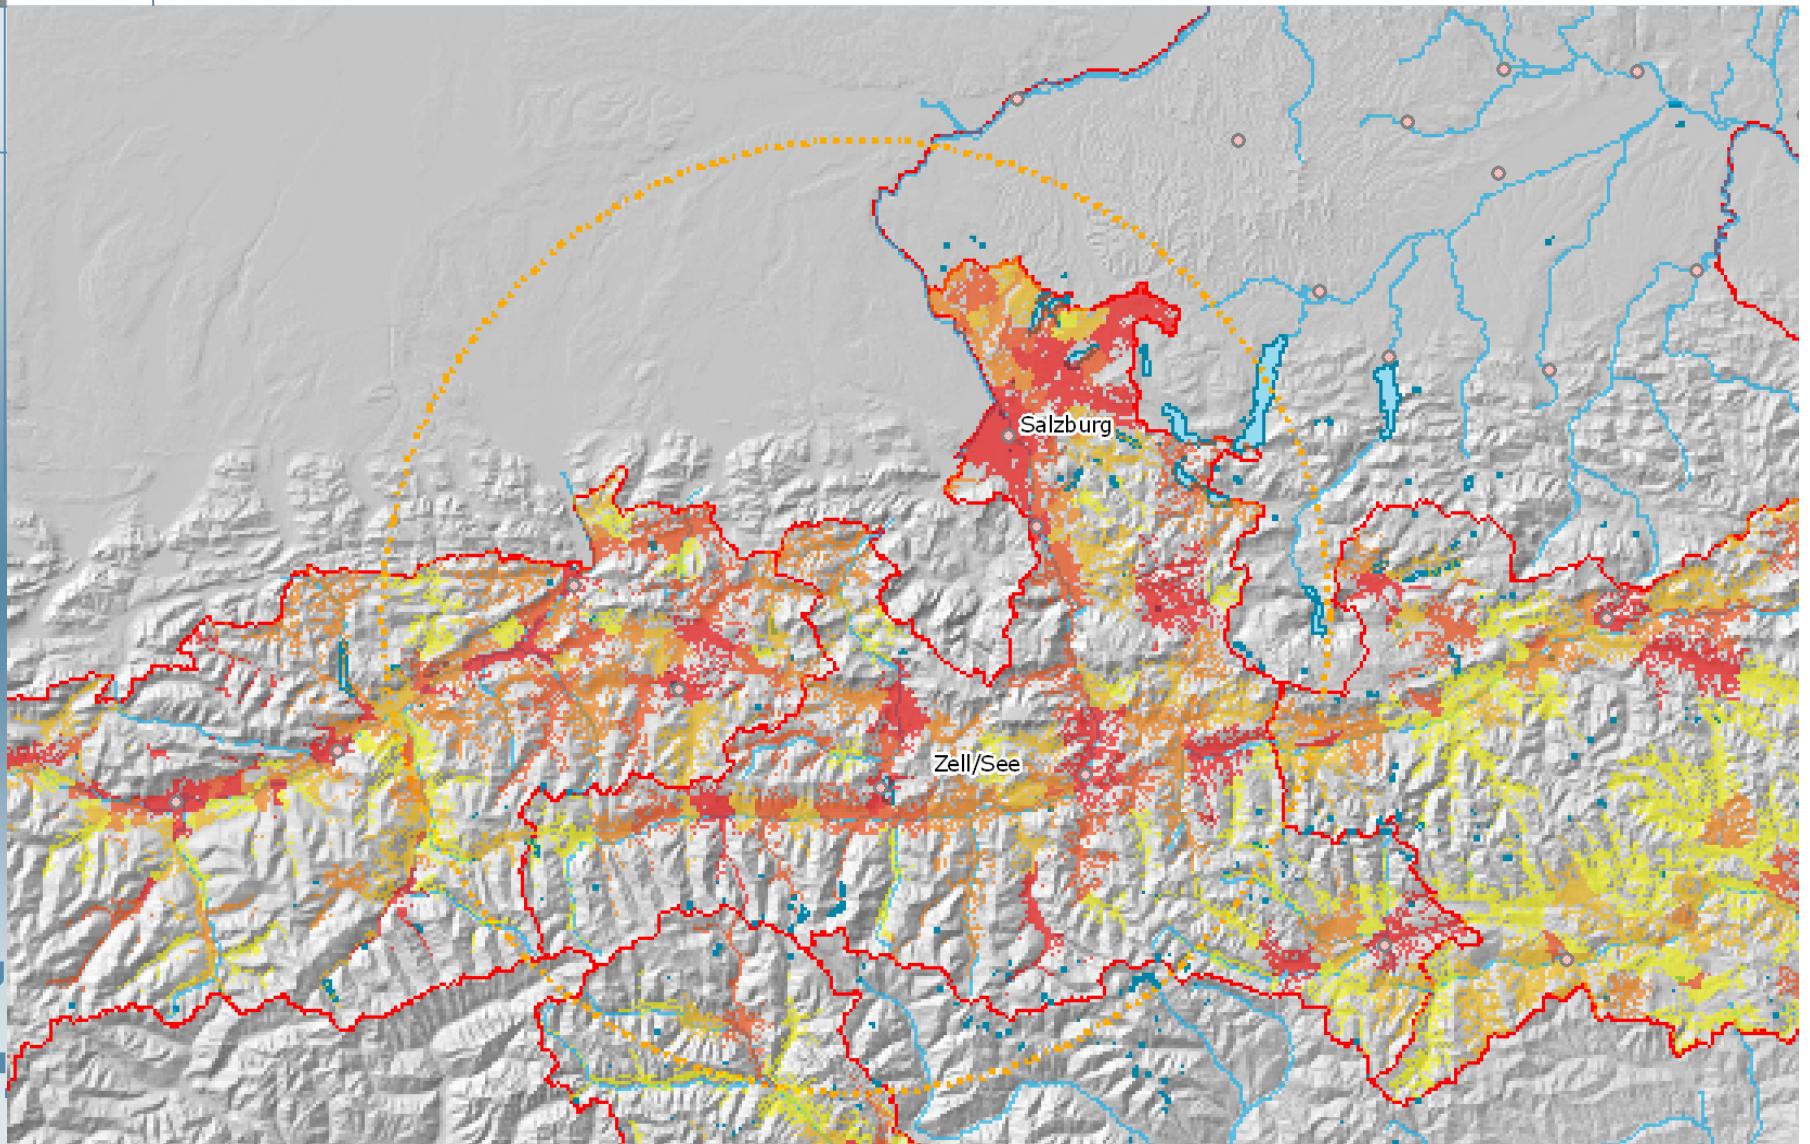

Verfeinerung
Disaggregation

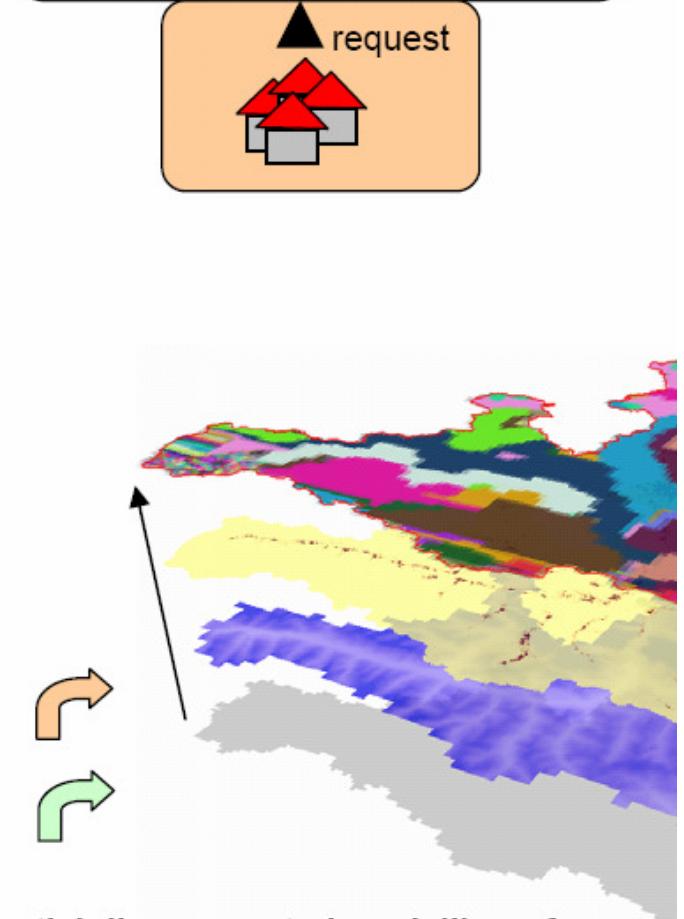

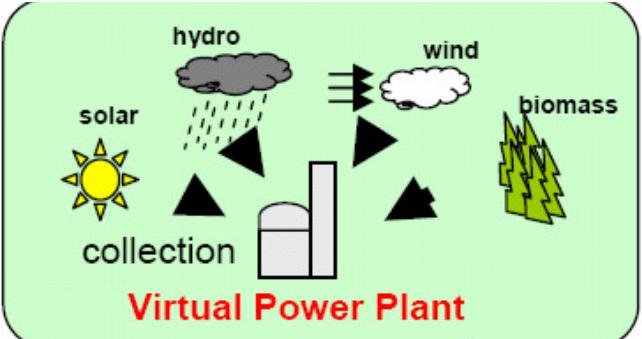

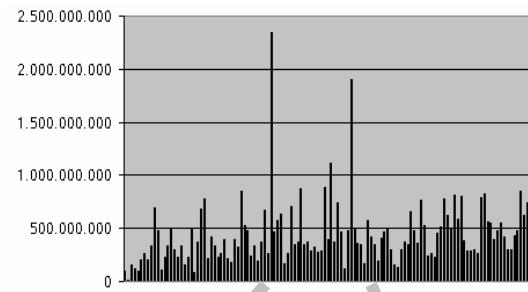

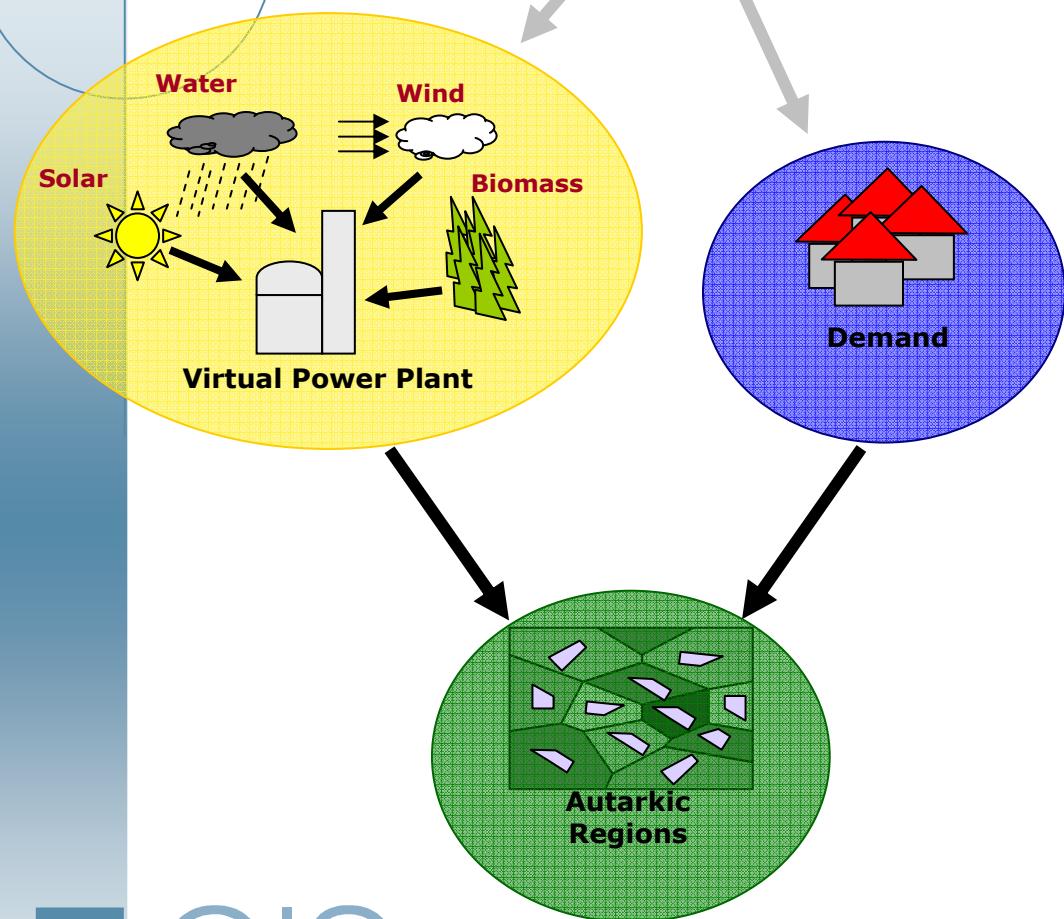

ZGIS

Demand forecast

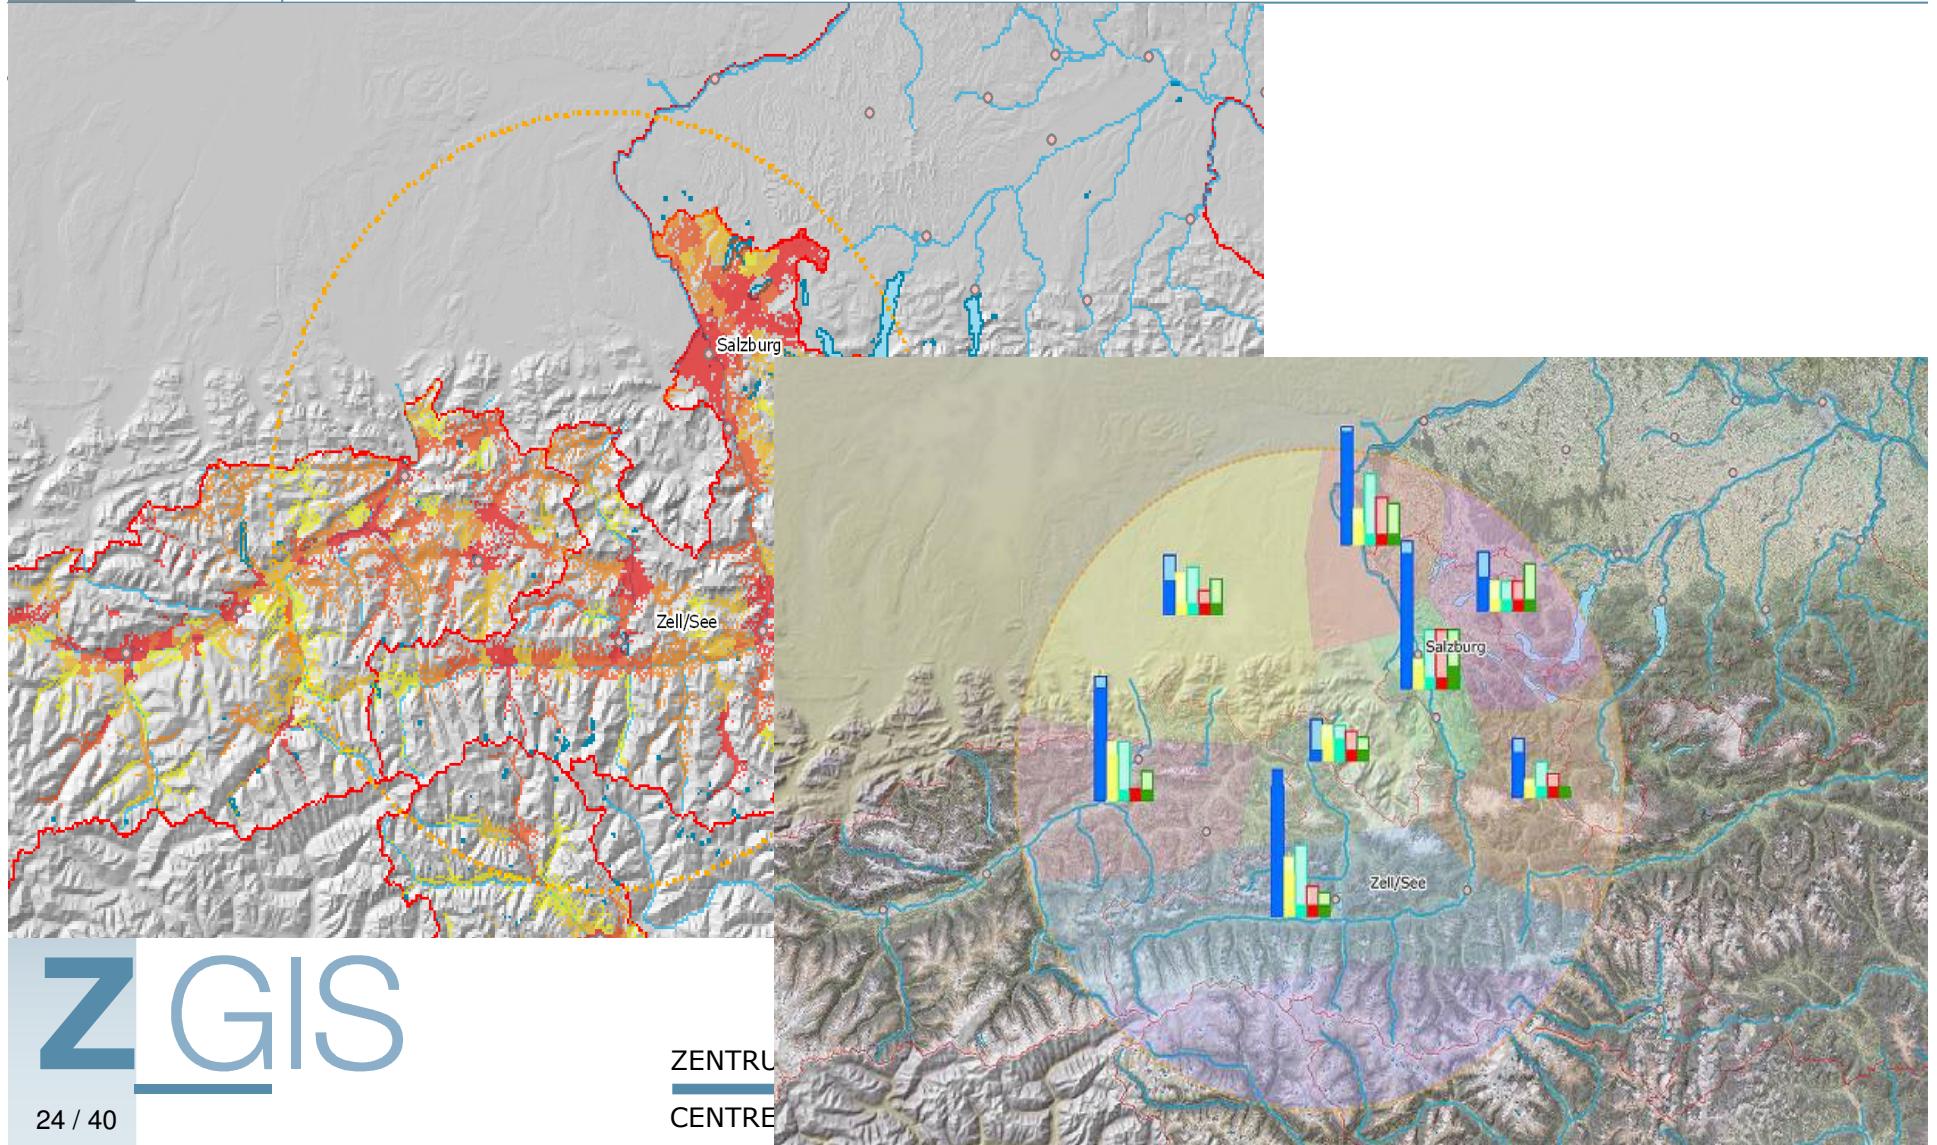

Spatial disaggregated modelling of:

- Solar power potential
- Wind power potential
- Hydro power potential

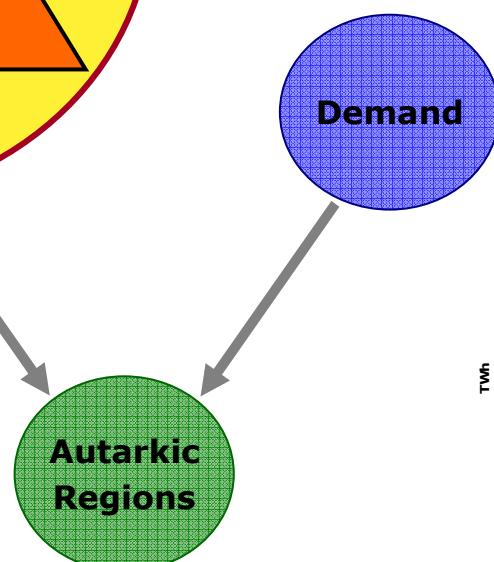

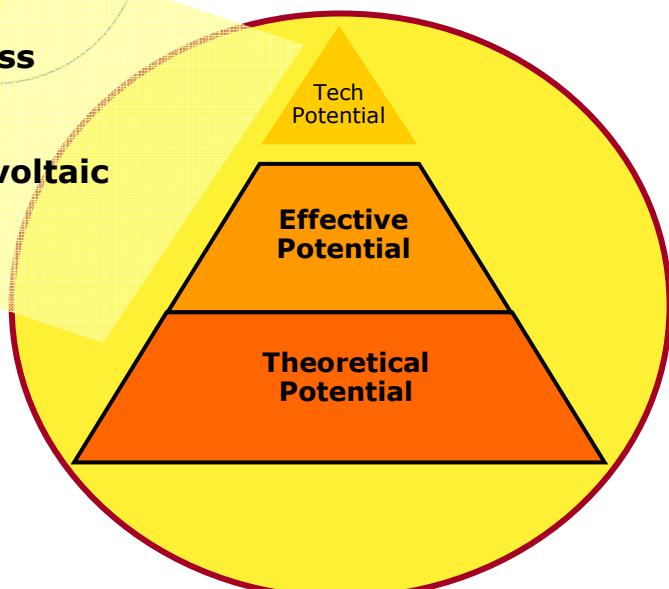

Universität
Salzburg

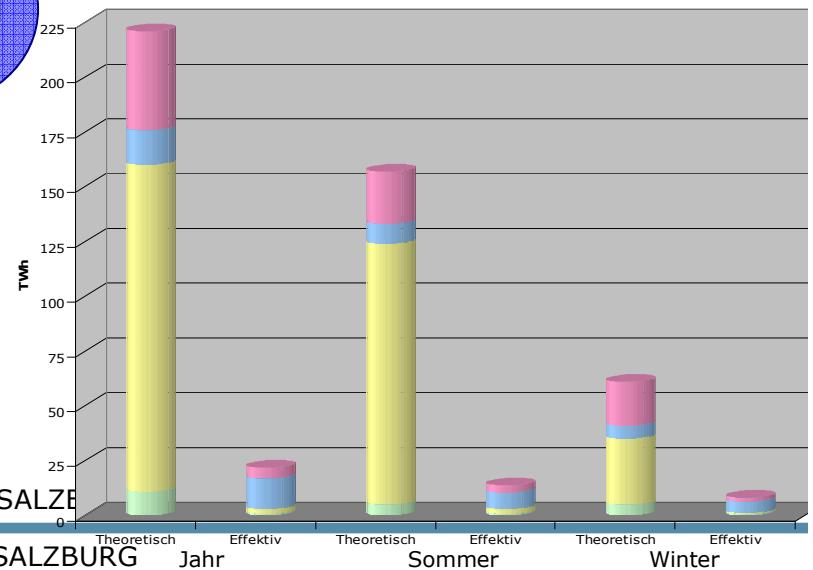

Virtual Power Plant

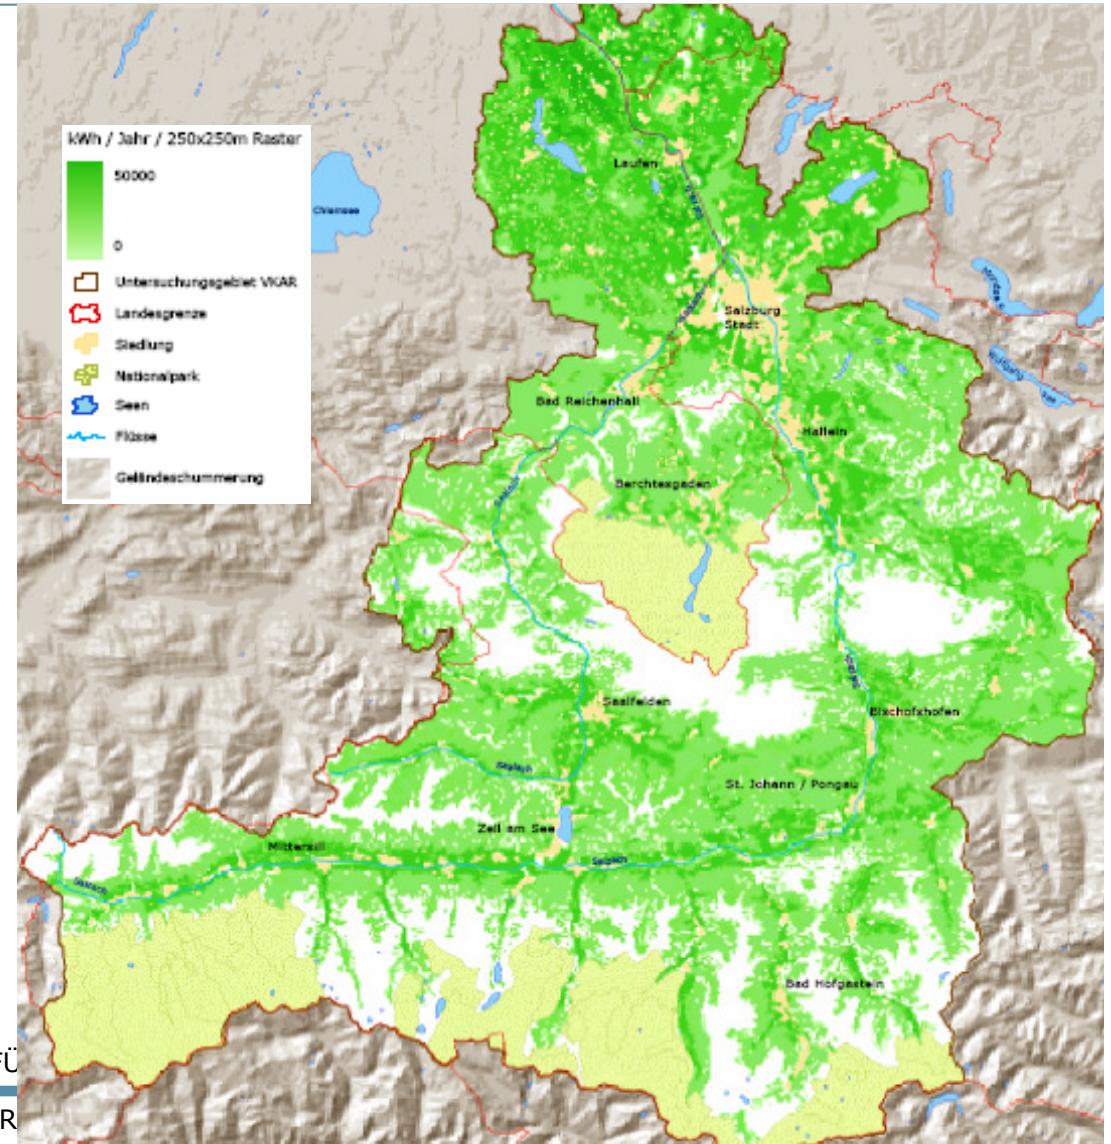

Generation Potentials

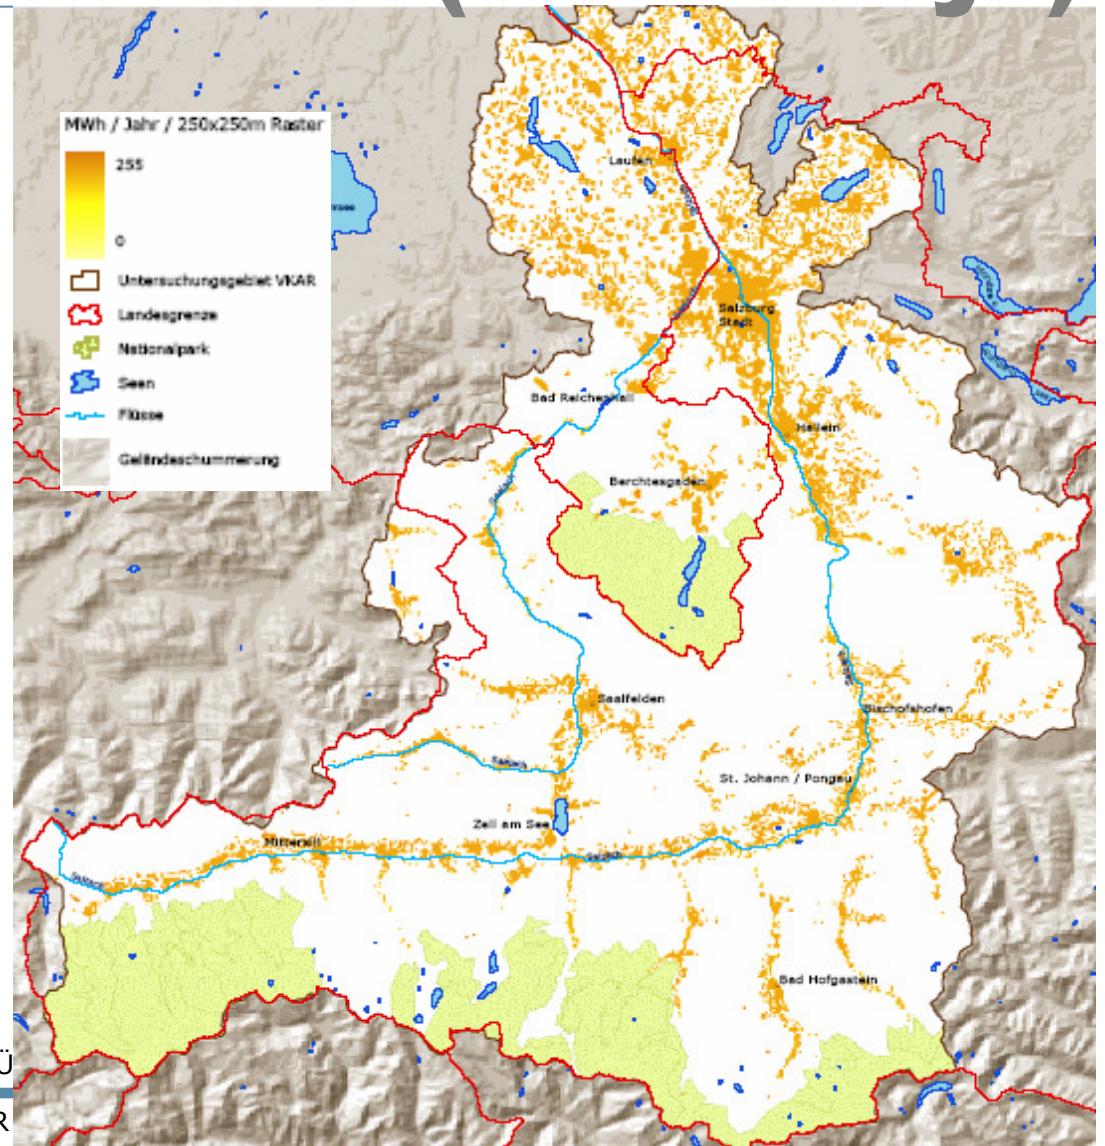

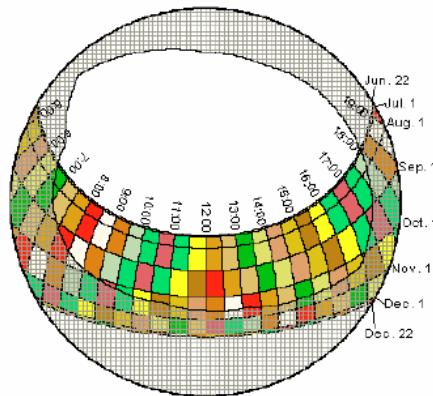

- Theoretical
 - Effective
 - Technical
- Potentials

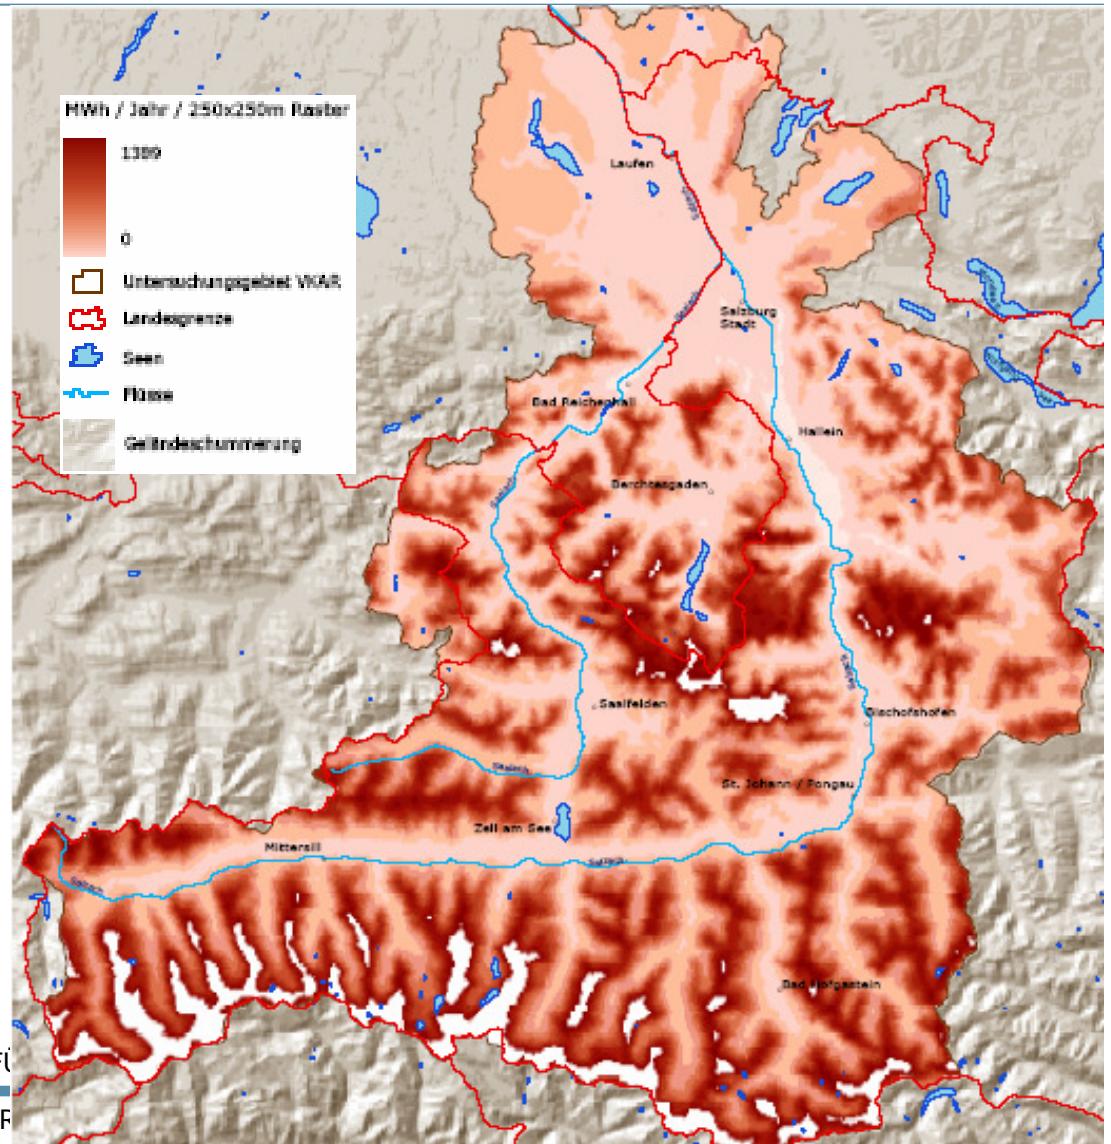

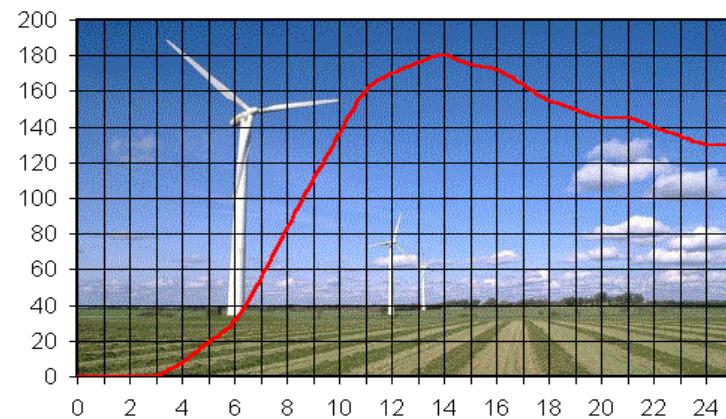

Effective Biomass Potential (~1 TWh/yr)

Effective Photovoltaic Potential (~2 TWh/yr)

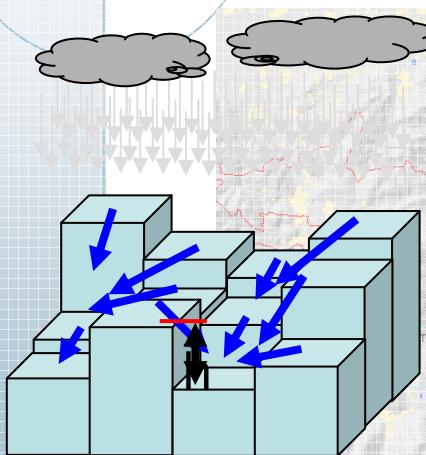

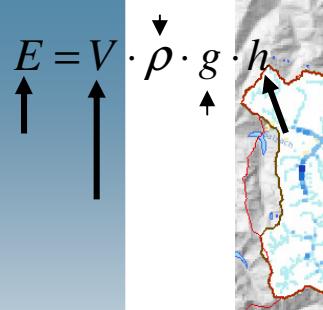

Effective Wind E. Potential (~45 TWh/yr)

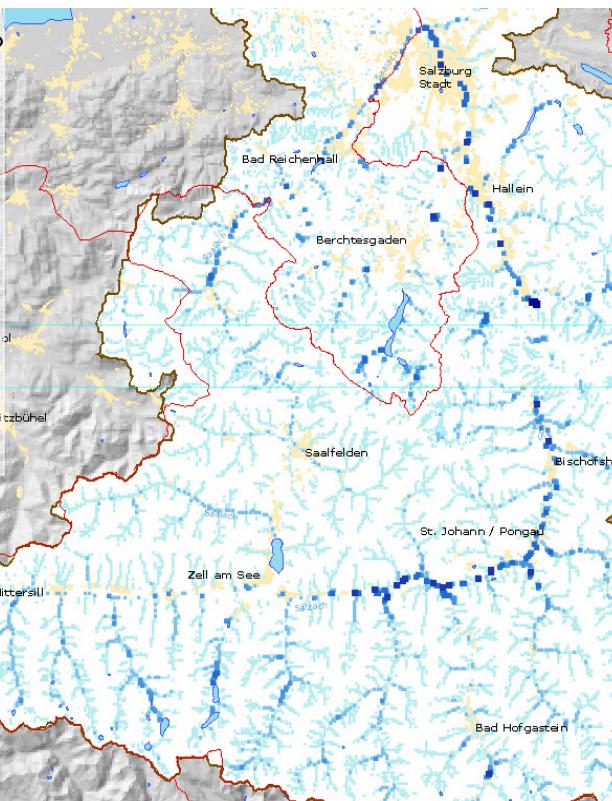

Hydropower Potentials

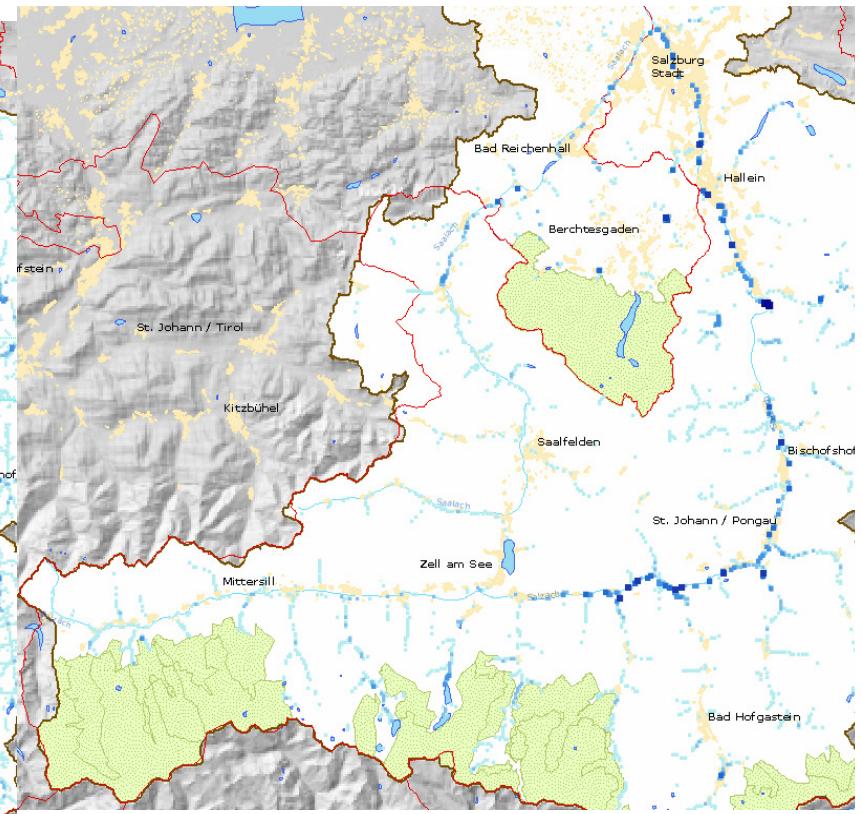

Theoretisches Potential (16,6 TWh)

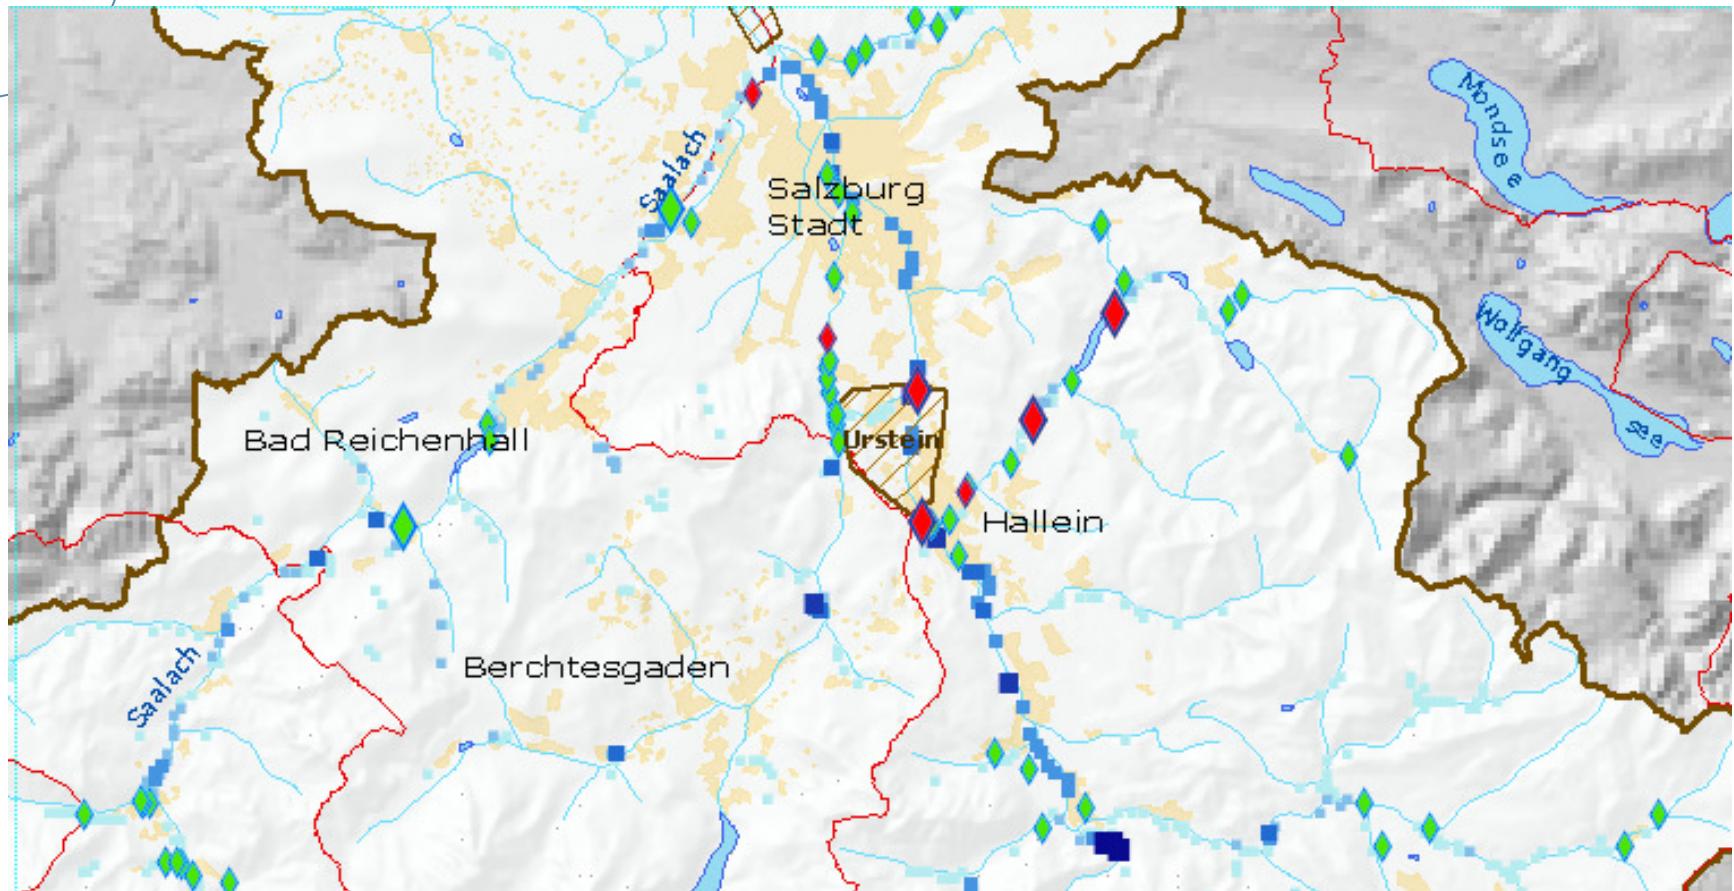

$$E = V \cdot \rho \cdot g \cdot h$$

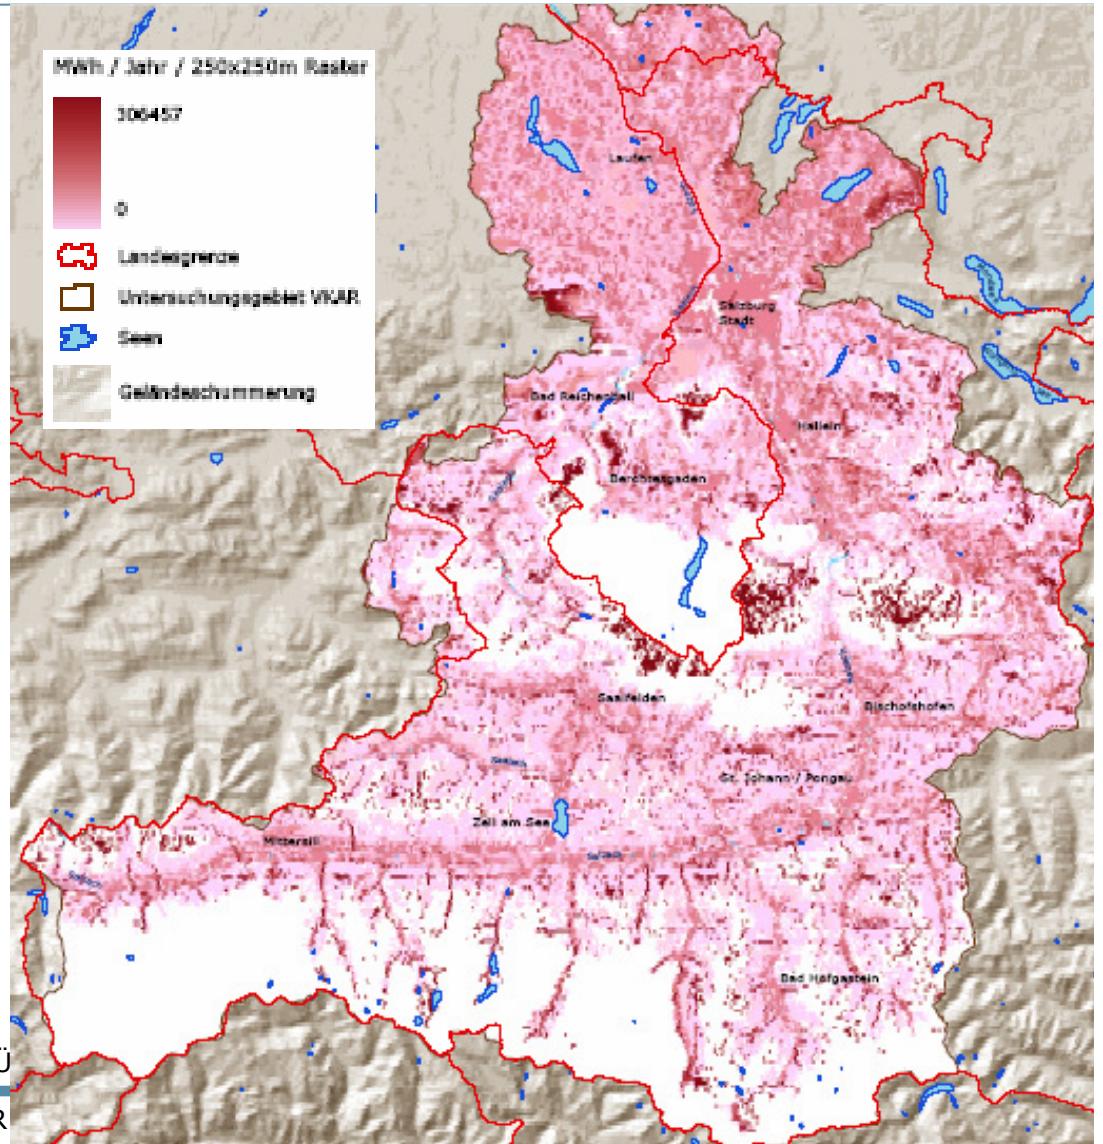

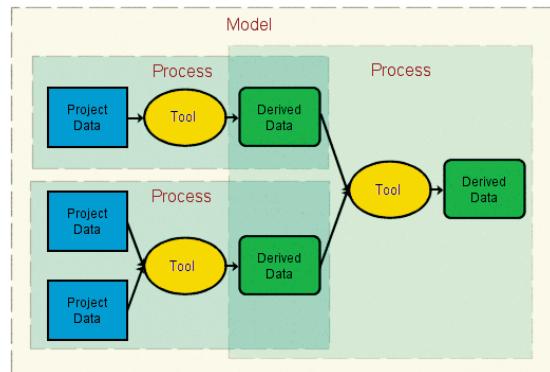

Effektives Potential (10.1 TWh)

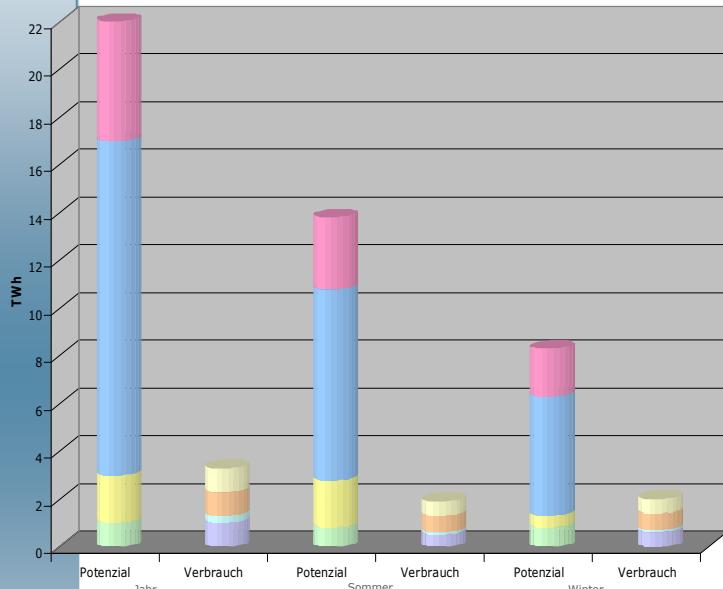

Hydropower: Site Selection

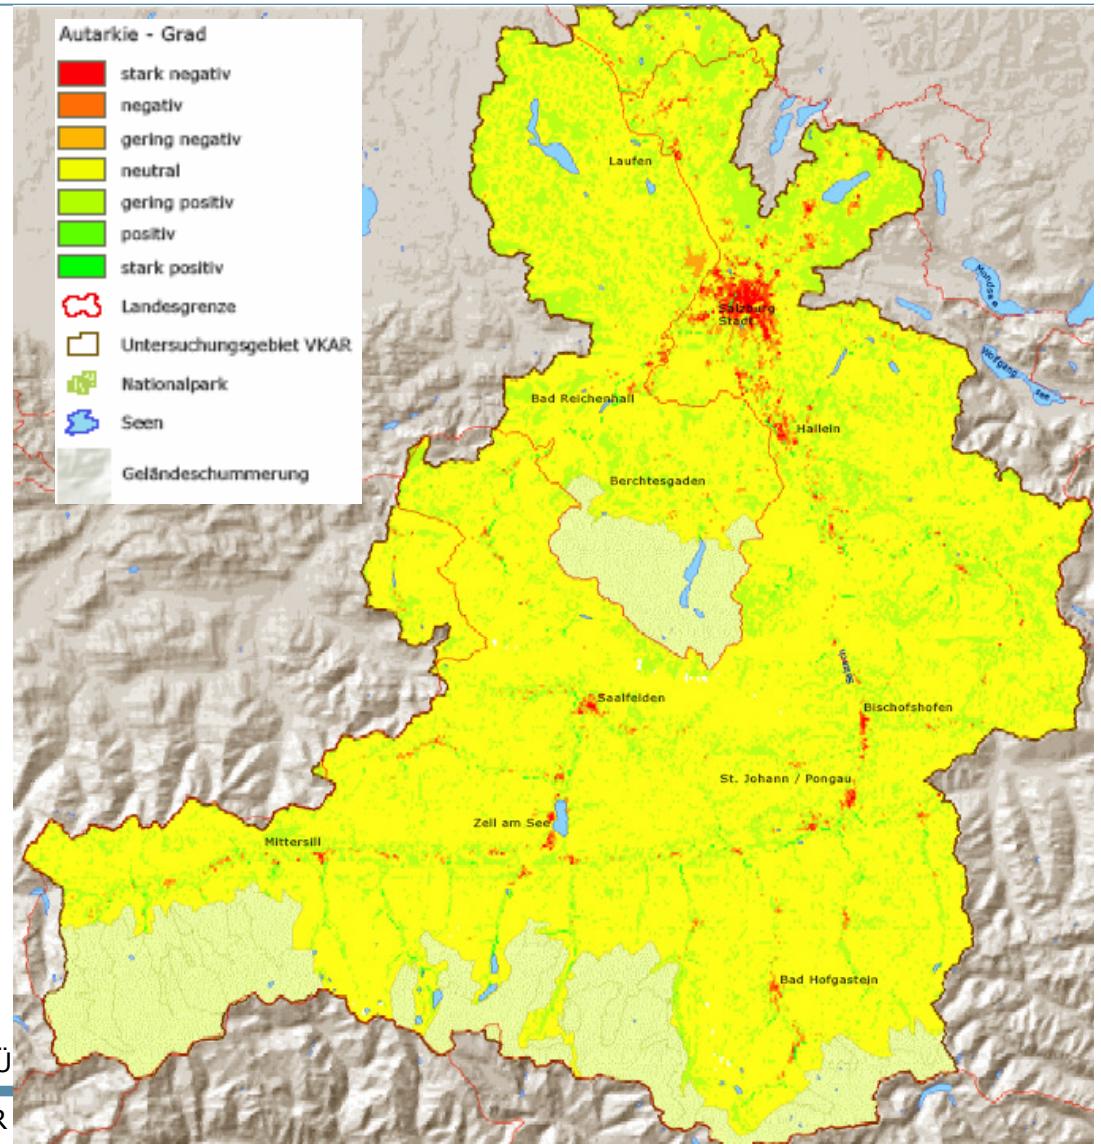

Total Effective Generation P. (~22 TWh/yr)

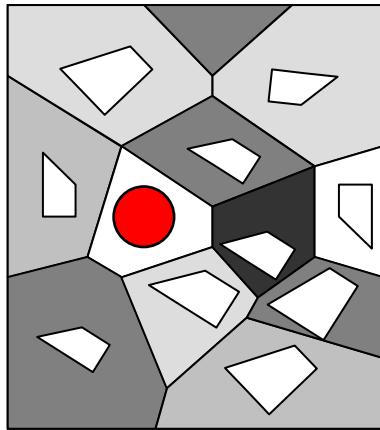

Regionalized Energy Balance

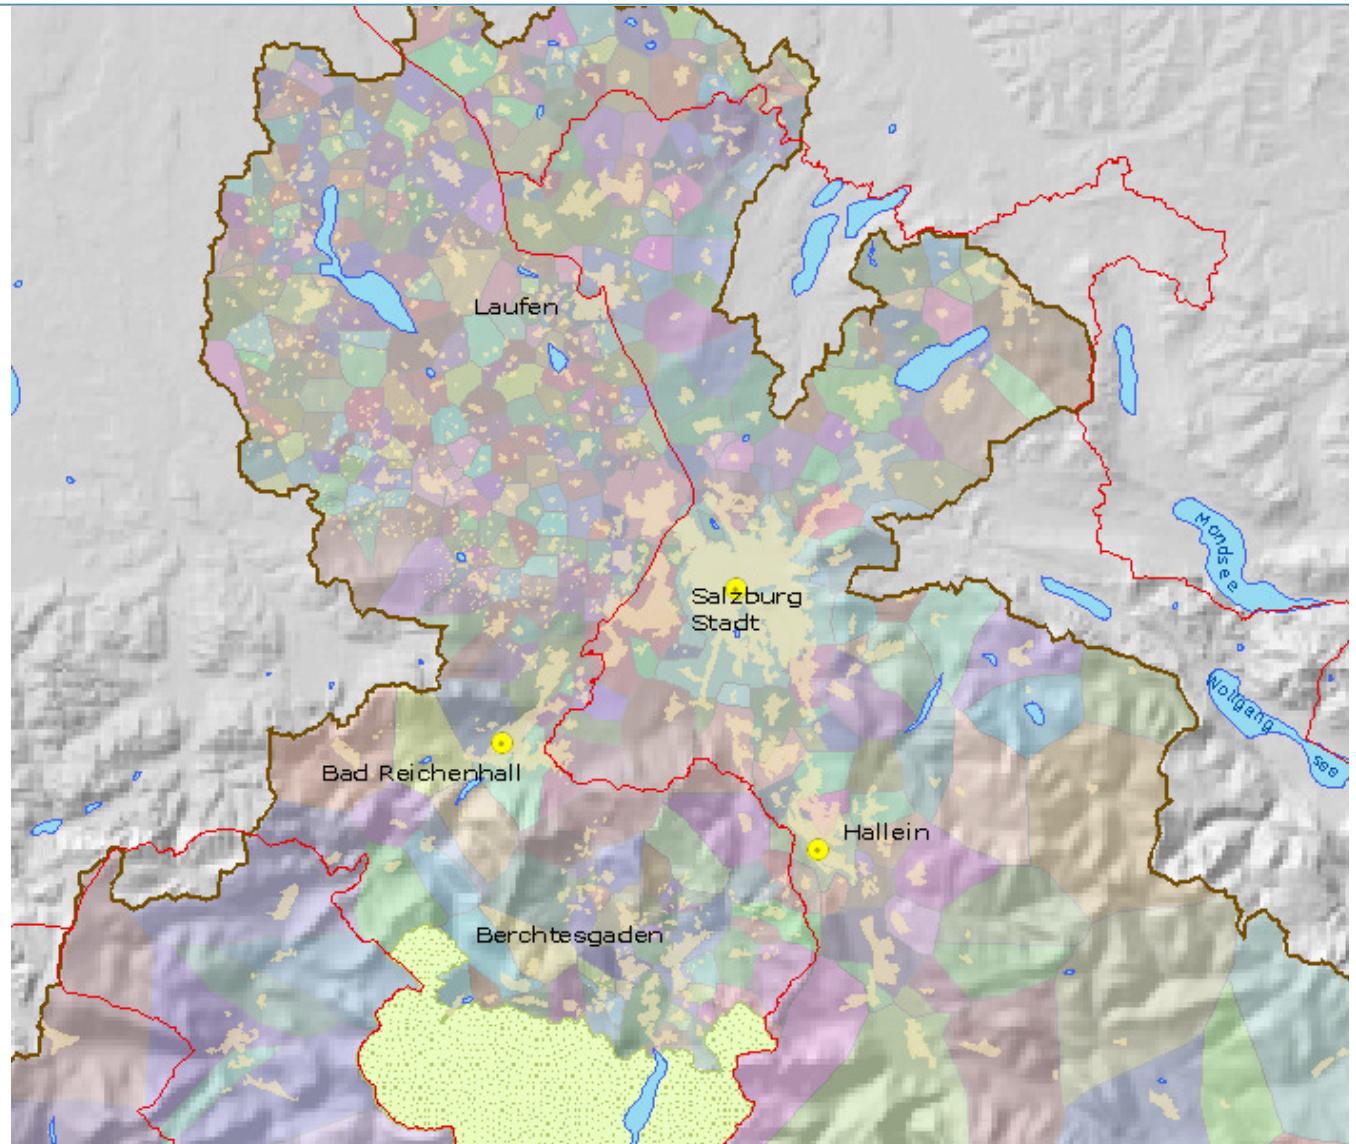

Universität
Salzburg

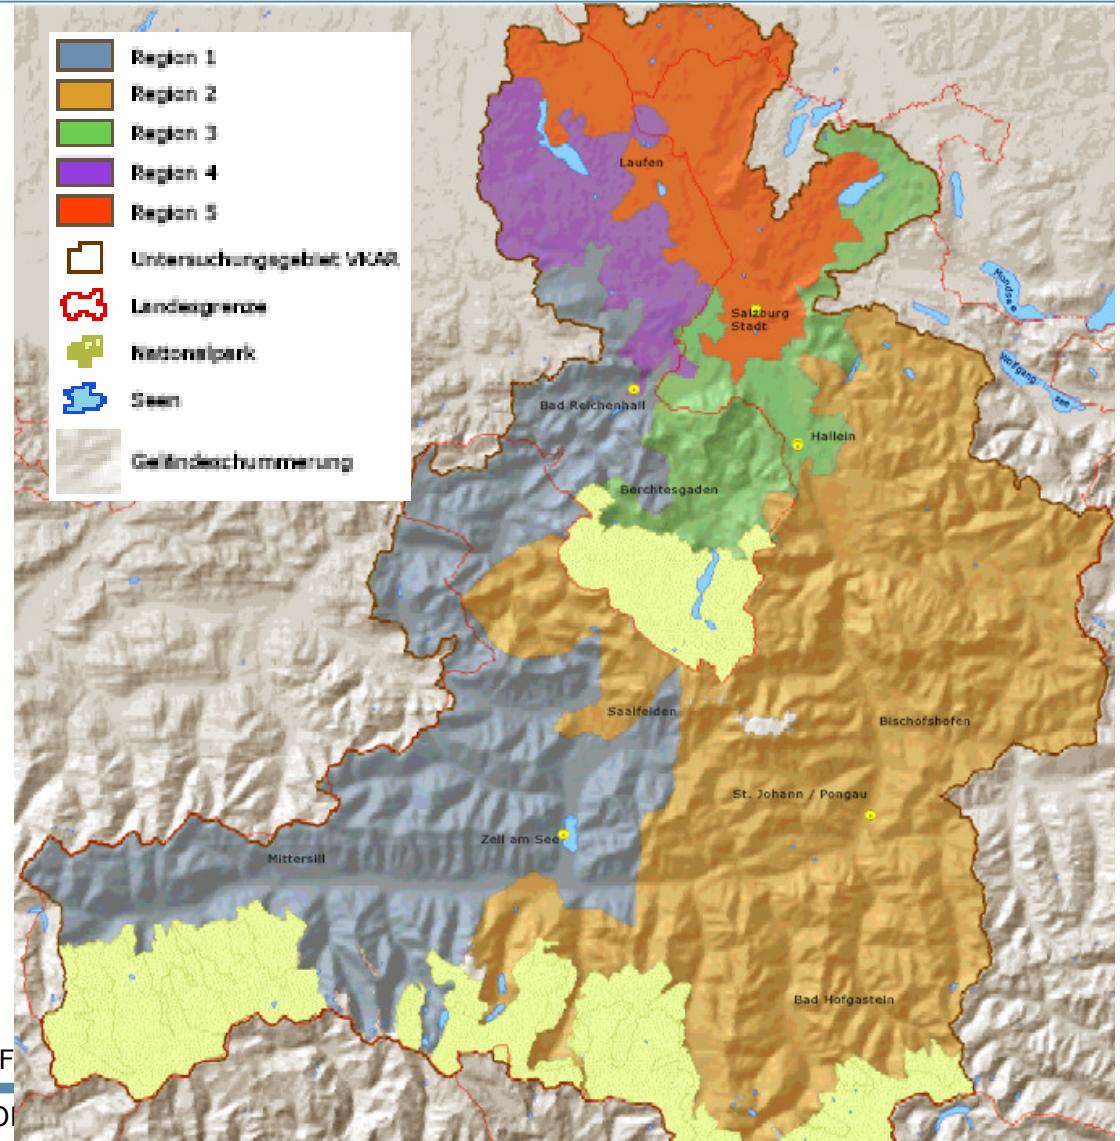

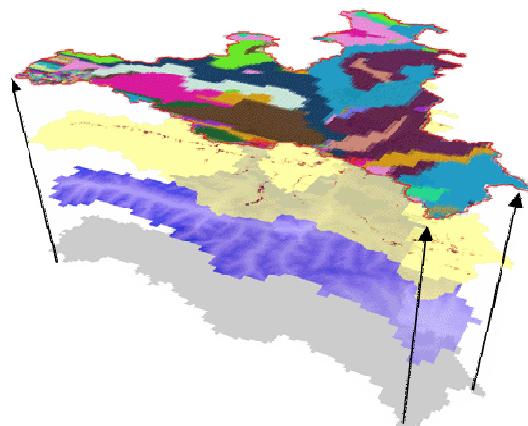

Region Growing Strategy

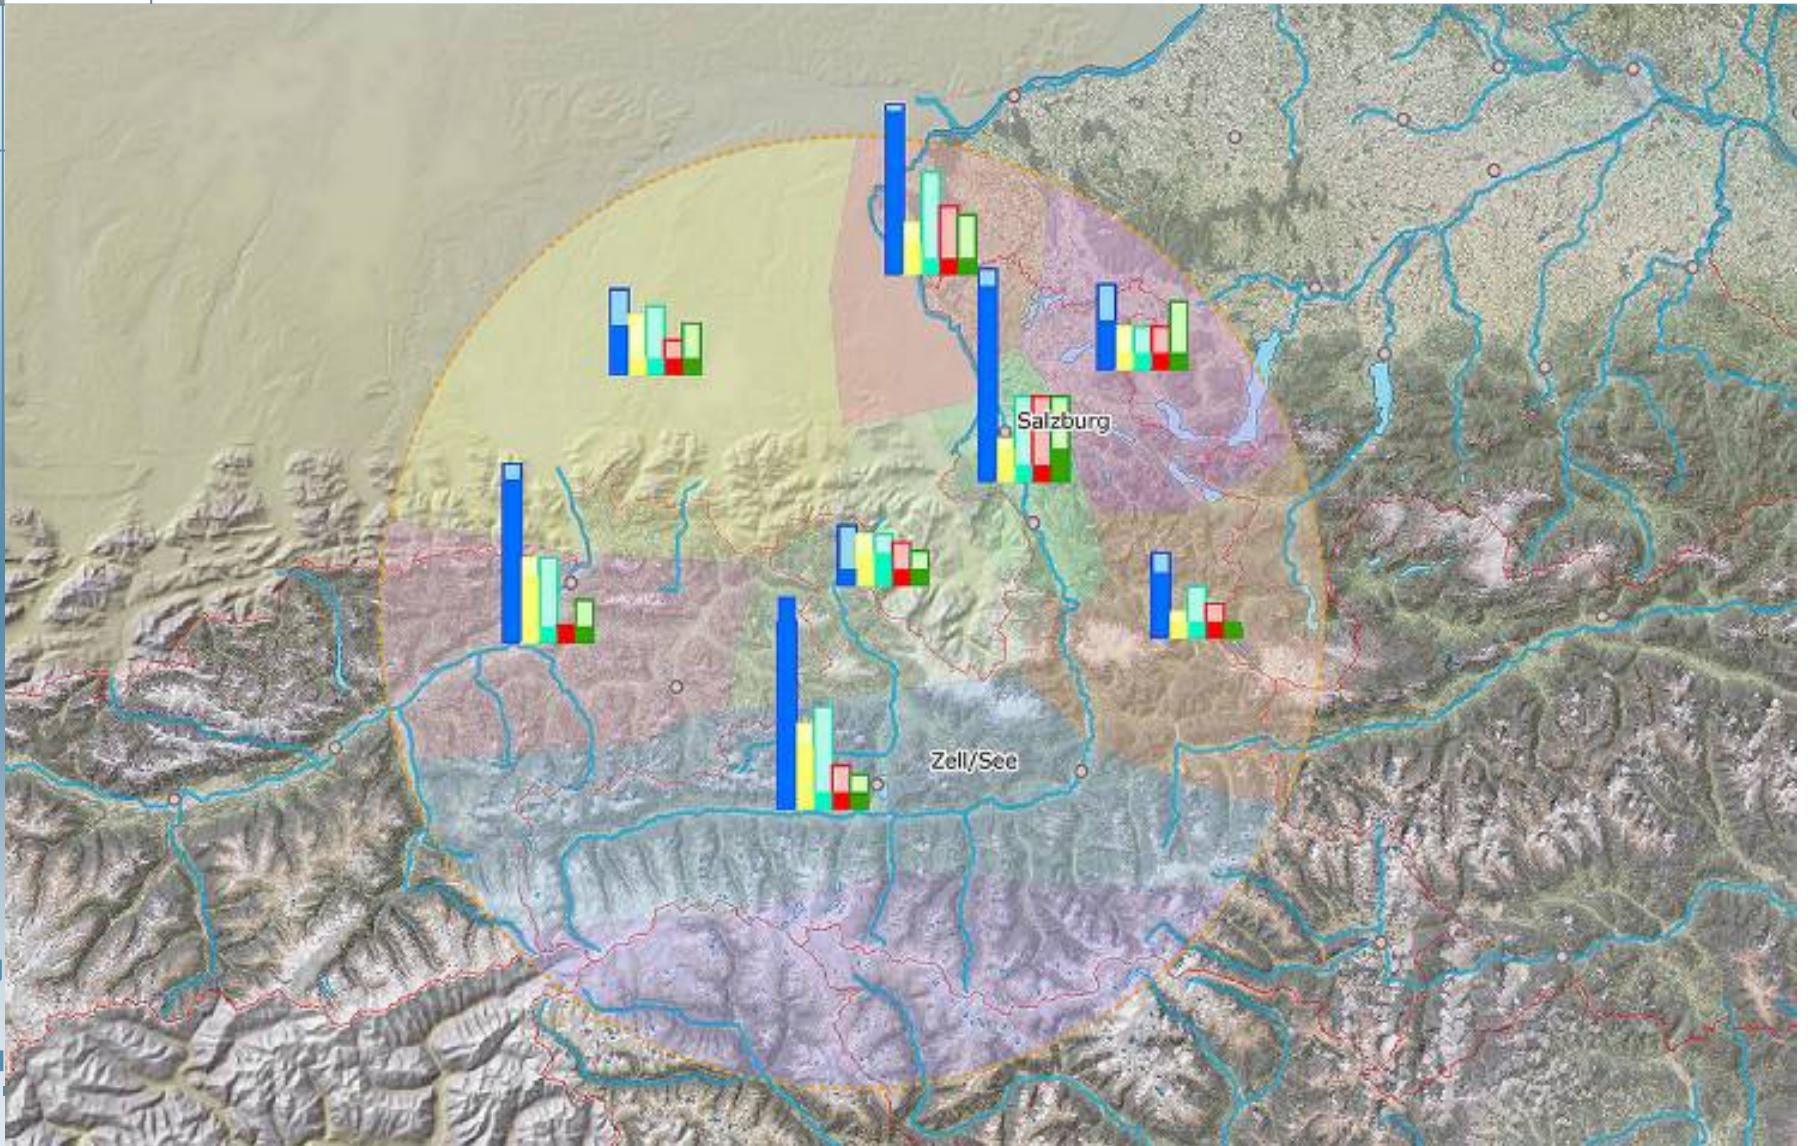

ZGIS

Autarkic Regions

Renewable Energy Sources

Conclusions / Directions

- Sustainable supply of energy is a local responsibility = distributed generation
- Temporal balancing is more challenging than totals
- Grid: from long-range transmission to intra- und inter-regional balancing
