#### Outline

- Necessity for TEC modeling
- TEC from COSMIC radio occultation (RO) Data
- TEC Data organization
- The b-spline modeling technique
- Model validation using reserved RO TEC
- Model Validation using ionosonde TEC

#### Conclusions

Э

- A total of 331,776 TEC data values were needed to exist in 16 longitudinal, 24 latitudinal, 3 solar flux, 12 monthly, and 24 hourly bins, in order to determine the model coefficients.
- However, from the data of the entire study period, only 121,447 bins were filled with TEC data values

The TEC over African region was expressed as:

$$\text{TEC}(\mathbf{t}, \mathbf{d}, \mathbf{F}, \lambda, \varphi) = \sum_{i=1}^{24} \sum_{j=1}^{12} \sum_{k=1}^{3} \sum_{l=1}^{16} \sum_{m=1}^{24} a_{ijklm} N_i(t) \times \\ N_j(d) \times N_k(F) \times N_l(\lambda) \times N_m(\varphi)$$

# Conclusions (1/2)

- TEC data obtained from RO by COSMIC satellites were binned according to local time, seasons, solar flux level and spatially.
- The coefficients of b-splines that were fitted to the binned data were determined by means of the least square procedure
- Validation exercise revealed that
  - (i) the observed and the modeled TEC correlate highly,
  - (ii) the modeled TEC closely approximates the observed TEC.

・ 同 ト ・ ヨ ト ・ ヨ ト

- Validation of our model using TEC obtained from ionosonde stations yielded r values > 0.92 and RMSE < 5.56 TECU.</p>
- The validation results imply that our model can estimate fairly well TEC that would be measured by ionosondes over locations which do not have the instrument.
