LABORATÓRIO DE ANÁLISE E PROCESSAMENTO DE IMAGENS DE SATÉLITES

EUMETCast platform: Using open-access data to monitor flash droughts in Northeastern part of Brazil

Presented by Dr. Humberto A. Barbosa, Coordinator of Lápis
barbosa33@gmail.com

12-14 September 2023 Graz, Austria

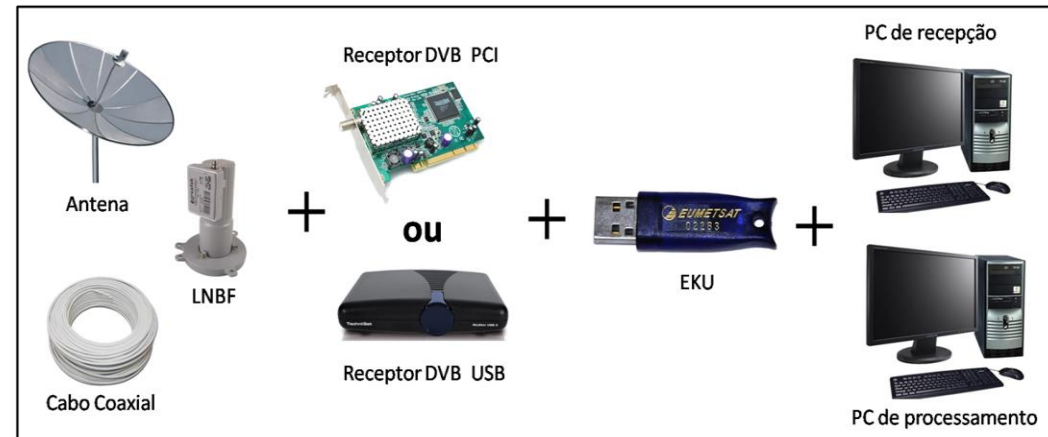

Database: Sharing EO data and products via EUMETCast

Online coupling to the drought observatory:
Update and live feed

Setting up receiving stations

Urgent need for a
database of actors
related to drought

Historic Drought at Brazil

Droughts

How do we approach drought risks?

different ways to address droughts

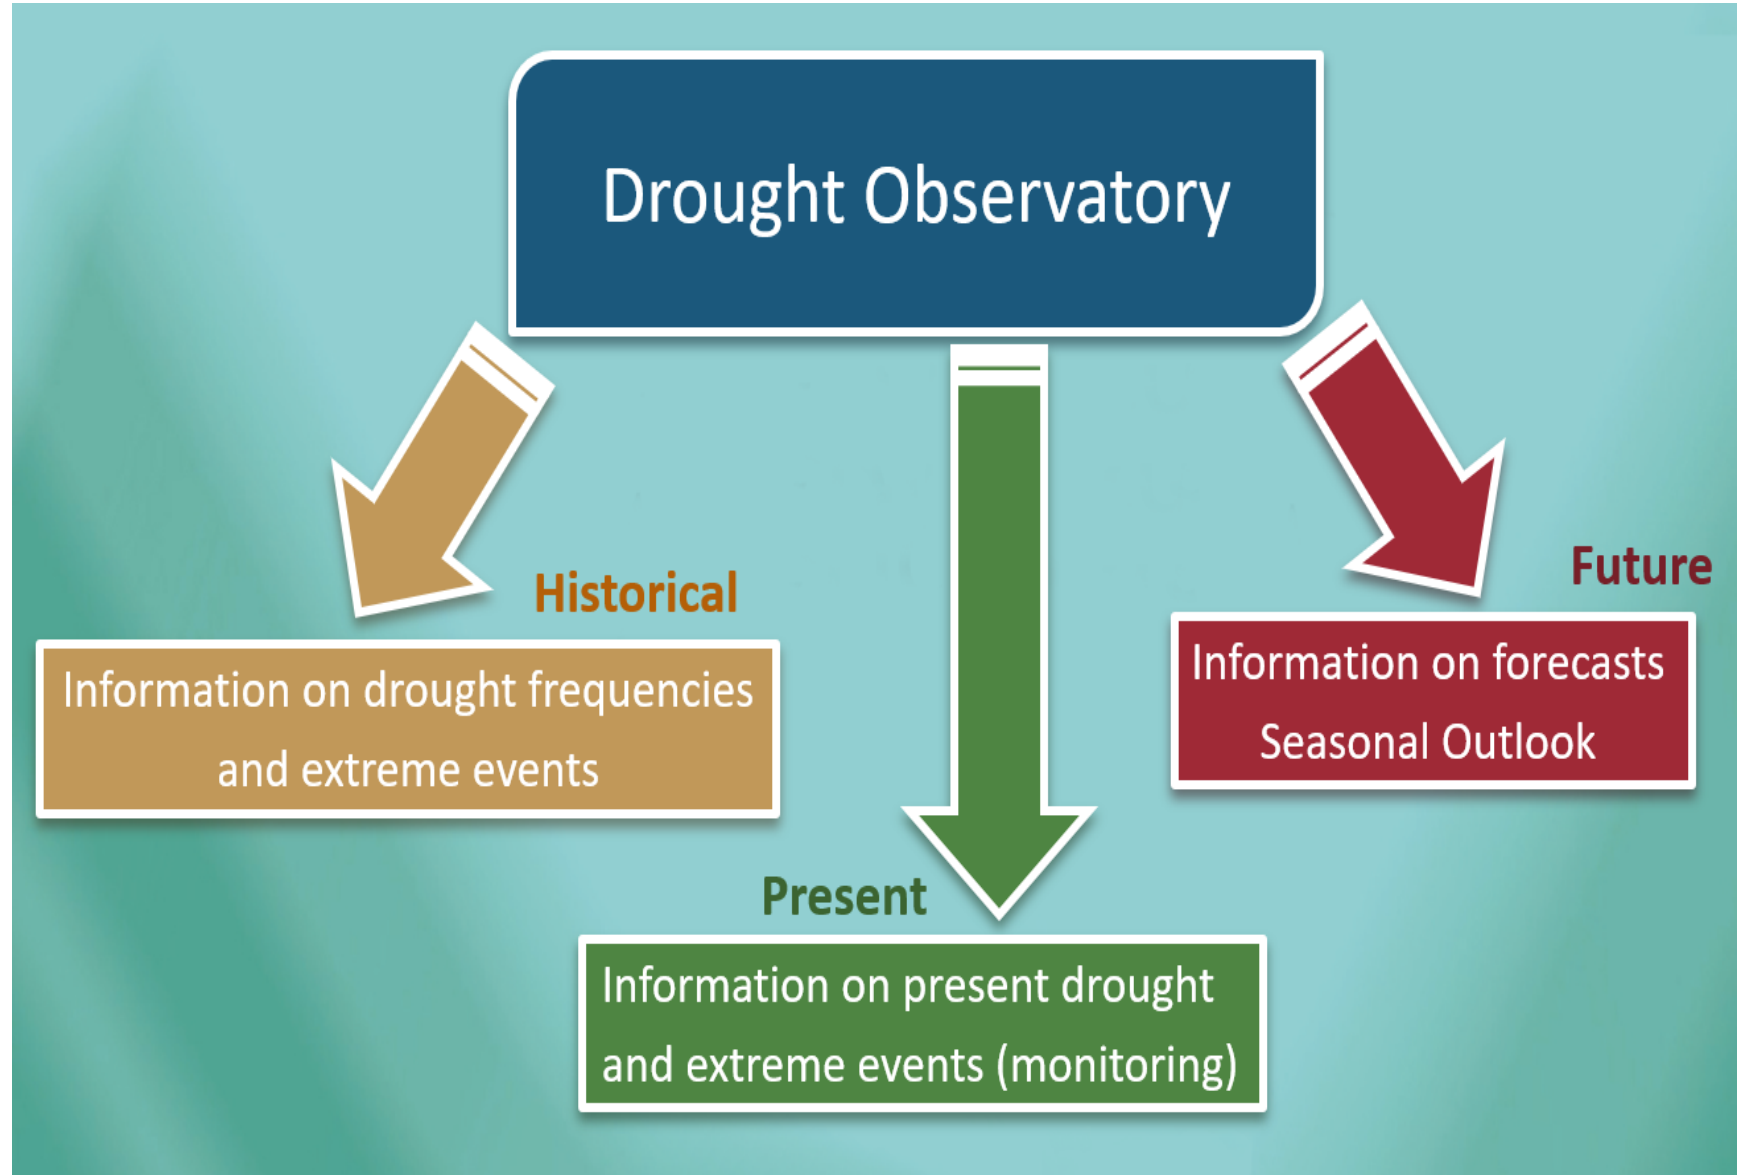

Objectives of the Brazilian Drought Observatory (BDO)

Requirements:

1. Count with all relevant agroclimatic information that:
 - are easy accessible
 - are up-to-date
 - consider different components of drought (meteorological, hydrological, agricultural and flash drought)
2. Be based upon already available local information and complement with additional international data sources
3. Allow identifying areas most affected by droughts to allow prioritizing actions
4. Count with a seasonal outlook, on the evolution of drought conditions
5. Count with an environment that allows developping new applications

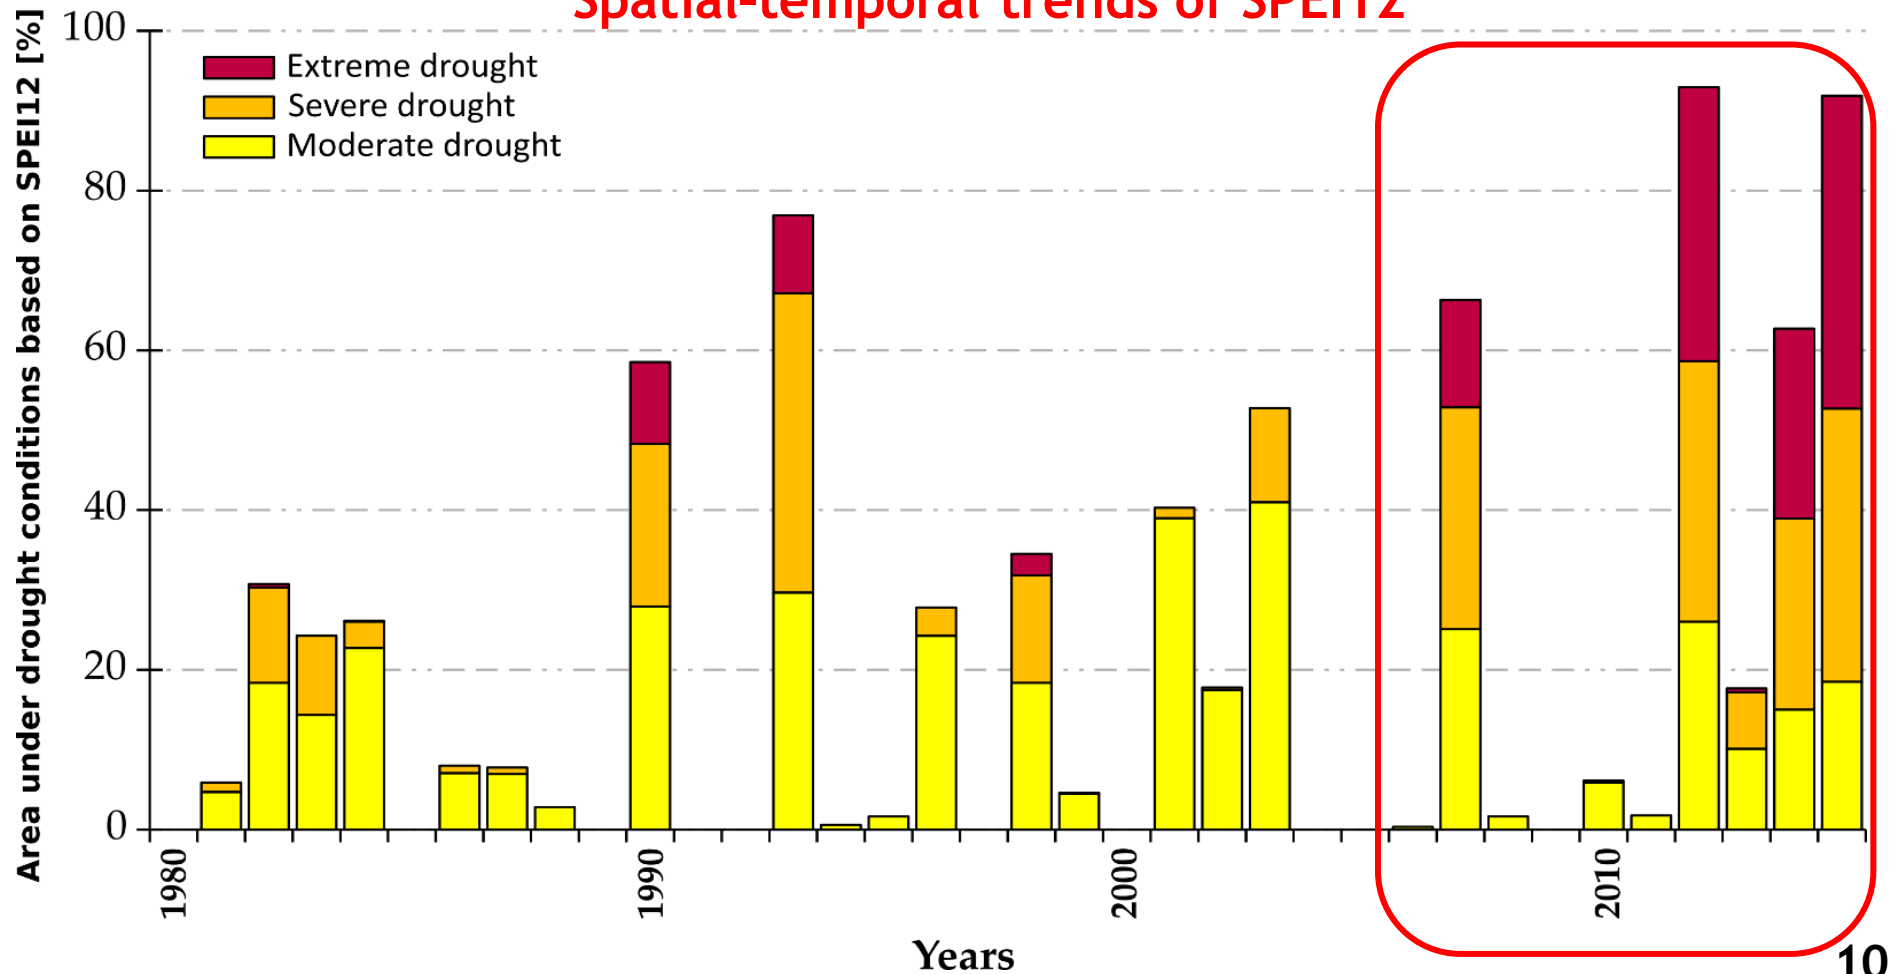

Architecture of the Brazilian Drought Observatory (BDO)

Northeastern Brazil (pilot region): Information on present drought and extreme events (monitoring)

Spatial-temporal trends of SPEI12

Pub. No.: BR 10 2018 075752 0 A2

Draft plan for drought

Processing learning

Developing a real-time learning plan for pilot (region or country): collect data and integrate lessons

Monitoring delivery

Delivery indicators: report early action

Evaluating impact

Indicator: income

Better information, accessible by everyone, will help accelerate the transition toward a net-zero economy

Questions funding

Q1) What types of drought tools or research has your institution funded, and how has that helped achieve your priorities?

Q2) What do you think are the great gaps in your priorities that drought "science and tools" could help close?

Q3) What strategies are there to enhance the drought science - governance linkages?

O Laboratório de Análise e Processamento de Imagens de Satélites (LAPIS) da Universidade Federal de Alagoas (UFAL) realiza atividades de pesquisa, assistência tecnológica e treinamento de recursos humanos para a recepção, processamento, interpretação e integração de imagens dos satélites da série METEOSAT. Para atender a essa demanda, em 2007 a UFAL instalou e operacionalizou a terceira estação de recepção de imagens do satélite METEOSAT Segunda Geração (MSG) do Brasil. Como atividades de pesquisa e transferência de conhecimento, a equipe do LAPIS elabora aplicativos para tratamento de imagens, disponibiliza produtos meteorológicos e ambientais derivados do MSG para setores operacionais e oferece treinamento na área. Desenvolvidas inteiramente com ferramentas open-source e freeware.
